European Technical Assessment Body for construction products

European Technical Assessment

ETA-22/0001 of 30 October 2024

English translation prepared by DIBt - Original version in German language

General Part

Technical Assessment Body issuing the European Technical Assessment:	Deutsches Institut für Bautechnik
Trade name of the construction product	fischer injection system FIS EM Plus
Product family to which the construction product belongs	Post-installed reinforcing bar (rebar) connections with improved bond-splitting behaviour
Manufacturer	fischerwerke GmbH & Co. KG Otto-Hahn-Straße 15 79211 Denzlingen DEUTSCHLAND
Manufacturing plant	
This European Technical Assessment contains	20 pages including 3 annexes which form an integral part of this assessment
This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of	EAD 332402-00-0601, Edition 09/2023
This version replaces	ETA-22/0001 issued on 31 July 2023

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

Specific Part

1 Technical description of the product

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the fischer injection system FIS EM Plus in accordance with the regulations for reinforced concrete construction.

Reinforcing bars with a diameter ϕ from 8 to 40 mm according to Annex A and the injection mortar FIS EM Plus are used for the post-installed rebar connection. The rebar is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded reinforcing bar, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connections of at least 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance to tension load (static and quasi-static loading)	See Annexes C1 to C3
Characteristic resistance to tension load (seismic loading)	See Annex C4

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1

Page 4 of 20 | 30 October 2024

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 332402-00-0601, the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 30 October 2024 by Deutsches Institut für Bautechnik

Beatrix Wittstock Head of Section *beglaubigt:* Stiller

Intended use Specifications part	: 1			Annex B1				

Specifications of intended use part 2

Anchorages subject to:

- Static and quasi-static loading: reinforcing bar (rebar) size 8 mm to 40 mm
- Seismic action: reinforcing bar (rebar) size 8 mm to 40 mm

Base materials:

- Compacted reinforced or unreinforced normal weight concrete without fibres according to EN 206:2013+A2:2021.
- Strength classes C20/25 to C50/60 according to EN 206:2013+A2:2021
- Maximum chloride content of 0,40 % (CL 0.40) related to the cement content according to EN 206:2013+A2:2021

Design:

- The structural design according to EN 1992-1-1:2011, EN 1992-1-2:2011 and Annex B3 and B4 are conducted under responsibility of a designer experienced in the field of anchorages and concrete works.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- Design under static and quasi-static loading and for seismic actions in accordance with EOTA Technical Report TR 069 June 2021.
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.
- The shear force must be transferred via the rough joint; the subsequent reinforcement must not be applied for shear force transfer.

Installation:

- Rebar installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site.
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).
- Rebars in overhead installation have to be fixed in their position until the injection mortar is cured.

³⁾ Cleaning nozzle and extension is only necessary if bore hole depth is greater than the le compressed-air cleaning tool

fischer injection system FIS EM Plus

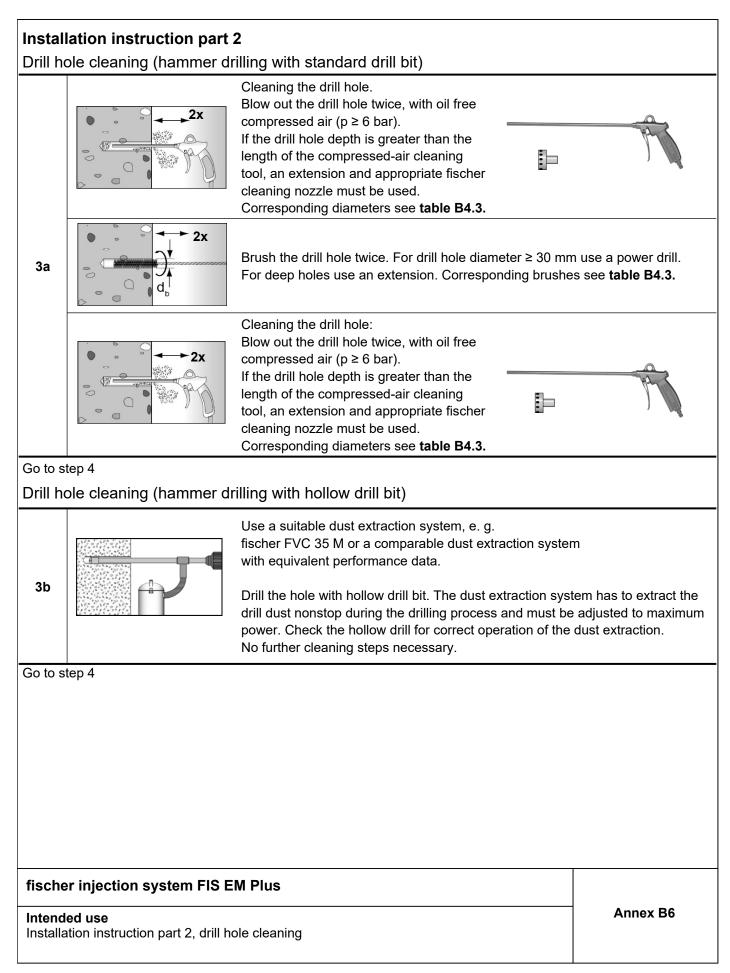

Intended use

Conditions for use static mixer without an extension tube; Working times and curing times; Installation tools for drilling and cleaning the bore hole and injection of the mortar Annex B4

		Refore use make esure that the rehar is dry and f	ree of all a
4		Before use, make asure that the rebar is dry and f other residue. Mark the embedment depth I_b (e.g. with tape) Insert rebar in borehole, to verify drill hole depth a depth $I_{b.}$	
5		Twist off the sealing cap Twist on the static mixer (the spiral in the static mi clearly visible).	ixer must b
6	fischer E2	Place the cartridge into a suitable dispenser.	
7	X	Press out approximately 10 cm of mortar until the permanently grey in colour. Mortar which is not gr will not cure and must be disposed.	
Goto	o step 8		

13011	t rebar		
9		Insert the rebar slowly twisted into the borehole until the er reached. Recommendation: Rotation back and forth of the reinforcement bar makes pu	
10		 After installing the rebar the annular gap must be complete Proper installation Desired embedment depth is reached I_b: embedment mark at concrete surface Excess mortar flows out of the borehole after the reb inserted up to the embedment mark. 	
11		For overhead installation, support the rebar and secure it f started to harden, e.g. using wedges.	rom falling till mortar
12		Observe the working time "t _{work} " (see table B4.2), which va temperature of base material. Minor adjustments to the rel performed during the working time Full load may be applied only after the curing time "t _{cure} " ha (see table B4.2)	par position may be
