SACE Tmax XT overview

Break new ground

Break new ground simply means delivering value through the entire customer journey by leaving behind the traditional concept of circuit-breaker. The SACE Tmax XT range offers a unique customer experience that, sharing the same features and logics with the Emax 2 range, for the first time ever overcomes the differences between molded case and air circuit-breakers. The most advanced products designed to maximize data and connectivity, ease of use and installation, performance and protection, safety and reliability.

The SACE Tmax XT range offers higher performance, better protection and more precise metering than equivalent units, and can handle from 160 up to 1200A.

Combined with the world's most precise electronic trip units in the smallest frames, the new range delivers significant time savings and enhances installation quality.

Reliability is further increased, and speed of installation reduced, thanks to Bluetooth and Ekip connectivity for mobile devices.

The SACE Tmax XT family's built-in connectivity links smartphones, tablets and PCs to data analysis tools on the ABB Ability™ cloud platform in real time. The extreme precision of the data measured means users have access to accurate information anywhere and anytime, making it easier to monitor resources and identify savings opportunities. Using the embedded smart power controller can help reduce energy consumption by up to 20 per cent.

Upgrading the breakers is straightforward: for the first time, customers can download new functions from ABB Ability Marketplace™, choosing among more than 50 different protection, metering and automation functionalities.

Distinctive features

Data and connectivity

Plant management of the future – SACE Tmax XT sets standards in modern plant and energy management. Access, monitor and control information remotely, anywhere, at any time. Improving efficiency and saving energy.

The SACE Tmax XT is the first molded case circuit-breaker to become an active element inside the electrical plant without using external accessories.

Local connection

Commissioning and device setting have never been so easy thanks to the Bluetooth connectivity and the Ekip Connect software.

Remote communication

All the data of the electrical plant are accessible and the interaction with the breakers from remote is straightforward thanks to the several communication protocols available.

Cloud connectivity

Cloud connection is now possible to exploit the full service of ABB Ability™ Energy and Asset Manager thanks to the Ekip Com HUB.

Distinctive features

Ease of use and installation

Maximum flexibility for every application – SACE Tmax XT sets standards for electrical installations. Easy selection, one-fits-all accessories and intuitive design pave the way for fast upgrades and create values through the entire customer journey. Even for the most critical projects.

Ease of selection

The clever organization of the SACE Tmax XT range and the user-friendly software e-Configure allows the customer to easily select and customize the right products for their needs.

One-fits-all accessories

Improving the circuit-breaker from its basic functions to a more versatile and sophisticated device is

made possible thanks to the SACE Tmax XT modular structure and the variety of available accessories.

Upgradability

The Ekip Touch and Hi-Touch trip units can always be upgraded via ABB Ability Marketplace™ and new functionalities shall be always available for an ever ending future.

Distinctive features

Performance and protection

Continuity of service and equipment protection – SACE Tmax XT sets standards when extreme breaking capacity is needed. Sharing the same logics, interfaces and features regardless of operating voltage environmental conditions. Embedding the most advanced protections into the smallest of frames.

Electrical performances

SACE Tmax XT is designed and tested to meet any installation requirement, even the most critical ones.

Metering

SACE Tmax XT provides all the tools needed to set up a competent and effective energy management strategy thanks to the trip units able to measure electrical parameters with 1% accuracy certification.

Protections and logics

SACE Tmax XT integrates extra functionalities into the size of a standard molded case circuit-breaker. The most advanced protection functions and logics are available thanks to its cutting-edge trip units.

Distinctive features

Safety and reliability

Absolute attention to detail, with style from design to manufacturing SACE Tmax XT sets standards for edge technologies. Half a century of research and experience means top-level products that are ready to face future challenges.

Products conformity

SACE Tmax XT circuit-breakers and their accessories comply with UL489 and CSA C22.2 Standards

Compliance with Standards

The Tmax XT circuit-breakers and their accessories are constructed in compliance with:

- Standards:
 - UL489 and CSA C22.2;
- Directives:
 - EC “Low Voltage Directive” (LVD) N° 2014/35/EC;
 - EC “Electromagnetic Compatibility Directive” (EMC) 2014/30/EC;

Shipping Registers:

- Lloyd’s Register of Shipping, Germanischer Lloyd, Bureau Veritas, Rina, Det Norske Veritas, Russian Maritime Register of Shipping, ABS.

Certification of conformity with product Standards is carried out at the ABB SACE test laboratory (accredited by ACCREDIA - certificate no. 0062L-02/2020) in compliance with UNI CEI EN ISO/IEC 17025 European Standard, by the Italian certification body ACAE, member of the European LOVAG organization and by the Swedish certification body SEMKO recognized by the international IECEE organization.

For more information about circuit-breakers, certified ratings and their corresponding validity, please contact ABB SACE.

Company Quality System

The ABB SACE Quality System complies with the following Standards:

- ISO 9001 International Standard;
- EN ISO 9001 (equivalent) European Standard;
- UNI EN ISO 9001 (equivalent) Italian Standard;
- IRIS International Railway Industry Standards.

The ABB SACE Quality System attained its first certification by the RINA certification body in 1990.

Environmental Health & Safety Management System, Social Responsibility and Ethics

Special care for the environment is a priority commitment for ABB SACE. This is confirmed through the company's Environmental Management System which is certified by the RINA (ABB SACE was the first industry in the electromechanical sector in Italy to obtain this recognition) in conformity with the International ISO14001 Standard. In 1999 the Environmental Management System was integrated with the Occupational Health and Safety Management System according to the OHSAS 18001 Standard and later, in 2005, with the SA 8000 (Social Accountability 8000) Standard. All this amounts to solid evidence of ABB's commitment to respecting business ethics and promoting a safe and healthy working environment.

ISO 14001, OHSAS 18001 and SA8000 recognitions together with ISO 9001 made it possible to obtain RINA BEST 4 (Business Excellence Sustainable Task) certification.

Product Material Compliance

The XT family complies with the following international regulations:

- RoHS II, Directive 2011/65/EU and Amendment 2015/863 - Restriction of Hazardous Substances;
- REACH, 2006/1907/EC, Registration, Evaluation, Authorisation and Restriction of Chemicals;
- WEEE 2012/19/EU -Waste Electrical & Electronic Equipment;
- Conflict Minerals - Dodd-Frank Consumer Protection Act. Section 1502.

Construction characteristics

All the SACE Tmax XT molded case circuit-breakers are built in accordance with the following constructional characteristics.

Double insulation

The Tmax XT circuit-breaker has double insulation between the live power parts (excluding the terminals) and the front parts of the apparatus where the operator works during normal operation. The mounting location of each electrical accessory is completely segregated from the power circuit, preventing any risk of contact with live parts. The operating mechanism especially is completely insulated from the energized circuits.

Furthermore, the circuit-breaker has oversized insulation, both between the live internal parts and near the connection terminals. Furthermore, the clearances exceed those required by the IEC Standards and fully comply with the prescriptions of the UL 489 Standard.

Insulation behaviour

In the open position, the circuit-breaker guarantees insulation distances in compliance with the UL489 Standard, thus preventing leakage currents to flow between the input and output terminals.

Positive operation

The operating lever always indicates the precise position of the moving contacts of the circuit-breaker, thereby guaranteeing safe and reliable signals, in compliance with IEC 60073 and IEC 60417 Standards (I = Closed; O = Open; yellow-green line = open due to protection trip). The circuit-breaker operating mechanism has a free release regardless of the pressure on the lever and the speed of operation. Protection tripping automatically opens the moving contacts: to re-close them, the operating mechanism must first be reset by pushing the operating lever from the intermediate position to the lowest open position.

Tropicalization

Circuit-breakers and accessories in the Tmax XT series are tested in compliance with the IEC 60068-2-30 Standard, carrying out 2 cycles at 55 °C with the “variant 1” method (clause 7.3.3). The suitability of the Tmax XT series under the most severe environmental conditions is further ensured with hot-humid climate according to climatograph 8 in the IEC 60721-2-1 Standards thanks to:

- molded insulating cases made of synthetic resins reinforced with glass fibers;
- anti-corrosion treatment of the main metallic parts;
- Fe/Zn 12 zinc-plating (ISO 2081) protected by a conversion layer, free from hexavalent chromium (ROHS-compliant), with the same corrosion resistance guaranteed by ISO 4520 class 2C;
- application of anti-condensation protection for electronic overcurrent trip units and relative accessories.

The ranges

SACE Tmax XT molded case switches (MCS)

Molded case switches are devices created from the corresponding circuit-breakers and feature the same overall dimensions, versions, and can be fitted with the same accessories.

Applications

These devices are mainly used as:

- general disconnection devices in sub-switchboards;
- switching and insulation devices for lines, bus bars or groups of apparatus;
- bus ties.

In the open position, the switch guarantees

a sufficient insulation distance (between the contacts) to ensure safety and to prevent an electrical arc from striking.

Protection

Each molded case switch must be protected on the supply side by a coordinated device which safeguards it against short-circuits.

The section "Coordination" in the table below shows the correspondence between each molded case switch and the relevant circuit-breaker.

Making capacity

The making capacity Icm is highly important since a molded case switch must be able to withstand the dynamic, thermal and current stresses which can occur during closing operations without being destroyed, right up to short-circuit closing conditions.

(2) the configuration for Tmax XT4D 150 is valid only with I1<150A setting on Tmax XT4 circuit breaker

Current Limiting

Existing UL circuit-breakers Tmax XT2, XT4 and XT5 have undergone specific tests as per the UL 489 Standard in order to be classified as UL current limiting circuit-breakers. They have specific characteristics in terms of limiting peak current and specific let-through energy.

According to the UL 489 Standard, current limiting circuit-breakers will be marked “Current Limiting” on the front and will have a label on the right side specifying the peak current and specific let-through energy values. Accessories and trip units are the same as available for standard UL Tmax MCCBs.

Circuit-breaker	XT2			XT4			XT5		
Trip Units	TMF, TMA, Ekip			TMF, TMA, Ekip			TMF, TMA, Ekip		
In	Up to 125A ⁽¹⁾			Up to 250A ⁽²⁾			Up to 600A		
Breaking Capacity	H	L	V	H	L	V	H	L	V

(1) Includes TMF, TMA with In = 15-125A and Ekip with In= 10, 25, 60, 100, 125A
 (2) Includes TMF, TMA with In = 25-250A and Ekip with In= 40, 60, 100, 150, 225, 250A

Circuit-breakers for single phase applications

Tmax XT three poles circuit-breakers, equipped with thermal-magnetic trip unit, can be used in single phase applications. For this purpose, they are

marked as follows according to UL standard:

- Suitable for single phase application up to 347 Vac
- Suitable for single phase application up to 600 Vac

	XT1	XT2	XT3	XT4	XT5	XT6	XT7
Up to 347 Vac	■	■	■				
Up to 600 Vac				■	■	■	■

100% rated circuit-breakers

All Tmax XT circuit-breakers are available both as standard version and as 100% rated version. Because of the additional heat generated bringing

100% of continuous current rating, the use of specific 90°C rated wires sized per 75°C ampacity may be required.

Fixed circuit-breakers

XT1	Suitable for continuous operation at 100-percent of rating up to 100A with 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire.
XT2	Suitable for continuous operation at 100-percent of rating up to 100A with thermal magnetic trip unit and up to 125A with electronic trip unit.
XT3	Suitable for continuous operation at 100-percent of rating up to 225A with 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire.
XT4	Suitable for continuous operation at 100-percent of rating up to 250A, with 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire. With 75°C wire suitable for continuous operation at 100-percent of rating up to 200A with lugs FC CuAl only.
XT5 400	Suitable for continuous operation at 100-percent of rating up to 400A. For XT5 V-X 90°C wire needed, the wire size shall be based on the ampacity of 75°C rated wire.
XT5 600	N-S-H-L versions suitable for continuous operation at 100-percent of rating up to 600A with 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire.
XT6	Suitable for continuous operation at 100-percent of rating up to 800A with electronic trip units and 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire.
XT7	Suitable for continuous operation at 100-percent of rating up to 1200A with 90°C wire. The wire size shall be based on the ampacity of 75°C rated wire.

For 80% - 100% rated enclosure dimensions and further installation details, please refer to the document "Technical characteristics SACE Tmax XT UL/CSA" (1SDC 210199D0202)

Circuit-breakers for motor protection

Main characteristics

When choosing and manufacturing a system for starting and monitoring motors, safety and reliability are important considerations. Motor starting is a particularly critical phase for the motor itself and for the installation powering it.

Even rated service needs to be adequately monitored and protected in order to deal with any faults that might occur.

When it comes to direct starting, ABB SACE offers two different solutions:

- a conventional system equipped with a circuit-breaker with a magnetic only trip unit for protection against shortcircuits, a thermal trip unit for protection against overloads and phase failure or unbalance, and a contactor to operate the motor;
- an advanced protection system which integrates all the protection and monitoring functions in the circuit-breaker itself and a contactor for operating the motor.

Conventional system

Several different factors must be considered when choosing and coordinating the protection and operating devices, e.g.:

- the electrical specifications of the motor (type, power rating, efficiency, $\cos\Phi$);
- the starting type and diagram;
- the fault current and voltage in the part of the network where the motor is installed.

Introduction

SACE Tmax XT trip units break new ground: they represent a new benchmark for the molded case circuit-breakers as they are able to satisfy any performance requirement.

The Tmax XT trip units are designed to be used in a wide range of applications. This complete, flexible protection trip unit can be adapted to the actual level of protection required, independently of the complexity of the system.

The range is available for three levels of performances, to meet any requirement, from simple to advanced applications.

- **TM, thermal-magnetic trip unit**
- **Ekip Dip, electronic trip unit**
- **Ekip Touch/Hi-Touch, electronic trip units**

Thermal-magnetic trip units

Used in both AC and DC networks, these are a solution for protection against overloads and short-circuits. Overload protection is ensured thanks to ABB thermal device based on a temperature dependent bimetal heated by the current. Protection against short-circuiting is realized with a magnetic device.

The Ekip Dip trip units

The first level of electronic trip units, used for the protection of AC network: these are based on microprocessor technologies and guarantee high reliability and tripping precision. They provide protection against overloads, selective short-circuits, short-circuits and earth faults. The power required for their operation is provided directly from the current sensors.

The Ekip Touch/Hi-Touch trip units

These represent the state of the art in terms of technology for AC network protection with advanced protection and system management functions. Diverse communication protocols enable the reading of measurement parameters and circuit-breaker control remotely.

Class 1 active energy measurement in compliance with the IEC 61557-12 Standard permits highly demanding requirements of energy efficiency to be satisfied. The integrated display makes interaction with the Ekip Touch/Hi-Touch an easy and intuitive experience for the user and the embedded Bluetooth functionality allows fast interaction via EPiC (Electrification Products intuitive Configurator), the new application to configure and check the status of the ABB low voltage circuit breakers.

The Ekip Touch trip unit guarantees maximum flexibility. In fact, by selecting among the numerous software solutions available, it is possible to customize the functionality of the device at will. On the other side, the Ekip Hi-Touch trip unit includes all functions by default, representing the top-of-the-line in the SACE Tmax XT offer.

New digital experience

With the new Ekip Touch and Hi-Touch trip units, it is always possible to select and install the desired functions on the device. The functions can be selected when ordering the circuit-breaker or downloaded directly from the ABB Ability Marketplace™, even from a smart phone or tablet, thus reducing installation time to zero.

New digital experience

Ekip Touch/Hi-Touch trip units can be now customized with the functions required.

—

Ekip Touch/Hi-Touch always allow the user to enter in a new product experience thanks to the possibility to build up his own tailor-made trip unit by selecting the set of protections, measurements and logics.

Circuit-breakers' customization has never been so easy.

With the new Ekip Touch and Hi-Touch trip units, the most advanced functionalities can be enabled following two different purchasing processes:

- **1 ABB Ability Marketplace™**

Users can download digital upgrades via web and enable them directly on the trip unit, without removing the circuit-breaker from the installation point, with zero shipping time and no installation costs. This process allows additional functions to be selected after the trip unit has been already received on site and installed. Moreover, stock can be optimized by keeping in the warehouse few types of trip units and customizing them according to the customer's specific needs. Once purchased, each function can be easily activated by using a smartphone or tablet via EPiC and embedded Bluetooth connectivity, or a laptop with Ekip Connect 3 and an Ekip T&P.

- **2 Traditional ordering**

This option represents the standard way to order ABB devices. The traditional process allows the users to select and directly install the desired functions when ordering the circuit-breaker. Once received and installed, SACE Tmax XT always offers the possibility to add new functionalities via ABB Ability Marketplace™.

The new Ekip digital offering includes:

- **Packages**

The software packages offer the possibility to customize the circuit-breaker by selecting additional protection functions and measurements. The device can be personalized to create tailor-made solutions according to the specific application. Maximum flexibility is guaranteed by offering specific technical features that can be combined in the Ekip Touch/Hi-Touch during the product life cycle.

- **Bundles**

Simplify the selection of advanced functions and logics with group of packages able to satisfy requirements by market segments and applications.

Bundles shall require additional plug and play hardware modules.

- **Solutions**

The SACE Tmax XT circuit-breaker is no more intended as a simply stand-alone protection device, but it has become an active player in the electrical system, able to exchange data and trigger actions managing the behavior of other connected devices. Thanks to the new electronic trip units, it is possible to implement transfer logics, load shedding and peak shaving strategies. Such solutions require additional plug and play hardware modules and other smart devices.

SACE Tmax XT allows to easily upgrade and customize the Ekip Touch and Hi-Touch trip units, guaranteeing maximum flexibility for any application, and delivering value throughout the entire customer journey.

1. Design

Build the circuit-breaker according to specific project requirements.

Key drivers

- Ease of doing business
- Technical specifications
- Application and function

Benefits

- Flexibility of choice
- Customization by application

2. Commissioning

Customize the device thanks to the digital offering. Manage last minute changes through digital upgrades.

Key drivers

- Ease of doing business
- Management of components
- Time to market

Benefits

- Stock optimization
- Zero lead time and installation effort

3. Service

Unlock the full potential of the circuit-breaker at any time, minimizing downtime and installation changes.

Key drivers

- Manage installed base
- Simplify diagnostics
- Simplify the hardware re-design

Benefits

- Zero lead time and installation effort
- Avoid downtime

New digital experience

Packages

Each package includes a set of protection functions or measurements that can be enabled in the trip unit.

Six packages relate to protection functions: Voltage Protections, Frequency Protections, Power Protections, Advanced Voltage Protections, ROCOF Protections and Adaptive Protections.

Voltage Protections

Set of protections included: UV - Undervoltage, OV - Overvoltage, UV2 - 2nd Undervoltage, OV2 - 2nd Overvoltage, PS - Phase Sequence, VU - Voltage unbalance.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Frequency Protections

Set of protections included: UF - Underfrequency, OF - Overfrequency, UF2 - 2nd Underfrequency, OF2 - 2nd Overfrequency.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Power Protections

Set of protections included: RP - Reverse active power, CosΦ - Power factor, D - Directional overcurrent, RQ - Loss of field or reverse reactive power, OQ - Reactive overpower, OP - Active over power, UP - Active underpower, RQ - 2nd Loss of field or Reverse reactive power.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Advanced Voltage Protections

Set of protections included: S(V) - Voltage controlled overcurrent, S(V)2 - 2nd Voltage controlled overcurrent, R - Residual voltage.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

ROCOF Protections

Set of protections included: ROCOF - Rate of change of frequency.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Adaptive Protections

Set of protections included: Dual Setting - Set A-B.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Three packages relate to measurements and diagnostics: Measuring Package, Data Logger and Network Analyzer.

Measuring Package

To monitor the plant through several measurements: Phase-to-phase voltage, Phase-to-neutral voltage, Phase sequence, Frequency, Active power, Reactive power, Apparent power, Power factor, Peak factor.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Data Logger

To record data about events in the plant: Currents, Voltages, Sampling rate, Maximum recording duration, Recording stop delay, Number of registers.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Network Analyzer

To monitor the power quality of the network through: Harmonic analysis, Hourly average voltage value, Short voltage interruption, Short voltage spikes, Slow-voltage sags and swells, Voltage unbalance.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

When a package is purchased via ABB Ability Marketplace™, it must be activated through:

- Ekip Connect 3 installed on a PC using Ekip T&P to scan the trip unit
- EPiC installed on a mobile device, by directly using the embedded Bluetooth connection available in the new Ekip trip units.

New digital experience

Packages

Thanks to the maximum flexibility guaranteed by these packages, the new Ekip trip units are now completely customizable. Depending on the specific trip unit version, different packages are available by default, but all of them can be added to the trip unit.

Default functionalities and upgradability of the trip units:

												
	Standard Protection	Standard Measures	Measuring Package	Voltage Protections	Frequency Protections	Power Protections	Adaptive Protections	Data Logger	Network Analyzer	Advanced Voltage Protections	ROCOF Protections	Power Controller
Ekip Touch	●	●	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑

Bundles

Each bundle includes a set of packages that can be enabled on the trip unit.

Five bundles are available to satisfy different needs: Intelligent Grid Edge, Power Management, Grid Connection, Diagnostics and Measure Advanced.

Intelligent Grid Edge

Make the grid smart.

Thanks to this bundle, the circuit-breaker becomes the main player of the smart interconnection of power distribution and loads for demand-supply coordination. Packages included: Measuring Package, Adaptive Protections, Power Protections, Voltage Protections and Ekip Power Controller.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Power Management

Embedded demand management.

Thanks to this bundle, the circuit-breaker is ready for demand management to ensure service continuity and reduce energy costs. Packages included: Measuring Package, Adaptive Protections, Power Protections and Voltage Protections.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Grid Connection

Optimize renewable power generation.

No more external and additional relays are needed with this bundle. It enhances tracking and improved energy harvesting. Packages included: Measuring Package, Adaptive Protections, Power Protections and Ekip Power Controller.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Diagnostics

Comprehensive data for root-cause analysis and preventive maintenance.

This bundle gives full diagnostics of the system to guarantee a full control of the plant status.

Packages included: Measuring Package, Network Analyzer and Data Logger.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

Measure Advanced

Embedded advanced metering and power quality information.

This bundle gives the possibility to preserve the loads, by avoiding equipment malfunctioning and optimizing energy consumption thanks to additional measurements and full power quality analysis. Packages included: Measuring Package, Network Analyzer.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

When a bundle is purchased via ABB Ability Marketplace™, it must be activated through:

- Ekip Connect 3 installed on a PC using Ekip T&P to scan the trip unit
- EPiC installed on a mobile device, by directly using the embedded Bluetooth connection available in the new Ekip trip units.

New digital experience

Bundles

The flexibility offered by the bundles allows also the selection of the proper functions that can be required by different segments and applications, purchasing only the needed functionalities.

New digital experience

Solutions

Five solutions are available to fully exploit the potential of the Ekip architecture: Embedded ATS, Adaptive Load Shedding and Ekip Power Controller.

Embedded ATS

This function enables the activation of auxiliary generation sources (e.g. generators) and transfers the feed of the loads from the distribution network to such auxiliary sources, thus ensuring a secure transfer to maintain service continuity and reliability of the system.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

The hardware accessories must be ordered via traditional ordering channels.

Adaptive Load Shedding

Thanks to this solution, the circuit-breaker enables islanding transition to avoid blackouts.

It actively controls the power consumption based on the priorities set by the user.

How to order: via ABB Ability Marketplace™ or traditional ordering channels.

The hardware accessories must be ordered via traditional ordering channels.

Ekip Power Controller

This function is the ideal solution for load management and represents an optimum compromise between reliability, simplicity and cost-effectiveness. Based on a patented calculation algorithm, Ekip Power Controller allows a list of loads to be controlled from remote according to the priorities defined by the user.

How to order: via ABB Ability Marketplace™ or traditional ordering channels. The hardware accessories must be ordered via traditional ordering channels.

When a solution is purchased via ABB Ability Marketplace™, it must be activated through Ekip Connect 3 installed on a PC using Ekip T&P to scan the trip unit.

These solutions require the installation of hardware components that must be ordered through the traditional ordering channels. For further information, please refer to the specific documentation available on ABB Library (www.abb.com/abblibrary/DownloadCenter/).

Offer

SACE Tmax XT trip units offer a solution for any installation requirement, from the building sector to industry, from marine purposes to datacenters any need is always satisfied.

The complete, flexible protection trip unit is classified in three different fields of applications as follows:

Power distribution protection

Tmax XT is the ideal solution for all distribution levels, from main low voltage switchboards to sub-switchboards, and also for transformers and drives. The field of application is very broad and ranges from residential and commercial buildings to infrastructure, microgrids, but also industrial environments, oil and gas installations, mining facilities, data centers, marine applications, wind and solar farms. Depending on the complexity of the system, it is possible to select between different performance levels. Thus, when higher protection accuracy is required, or advanced control systems are needed, it is always possible to choose the appropriate version.

Motor protection

Motors are used in several industrial sectors, like food and beverage, chemicals, metallurgic, paper, water and extractive industries.

When a motor system needs to be protected, the safety and reliability of the solution are important aspects that must be considered when choosing and manufacturing the system for motor starting and monitoring.

Start-up is a particularly critical phase for the motor itself and for the system powering it. When it comes to direct starting, the SACE Tmax XT range proposes different solutions, from magnetic only protection to a very advanced protection system.

Generator protection

Tmax XT has been designed to provide a solution for the protection of small generators and networks where distribution is realized through very long cables. In addition, it also provides protection for generators without using external devices that require dedicated relays and wiring. This solution minimizes the time needed for implementation and commissioning of the system, and ensures the high levels of accuracy and reliability required for running generators in applications such as naval, GenSet or cogeneration.

Offer

The Tmax XT trip units represent the ideal solution for any application up to 1200A.

The Tmax XT molded case circuit-breaker family complies with numerous installation requirements. Circuit-breakers are available with trip units dedicated to three different application groups. The table below shows the trip units for each circuit-breaker frame and the related rated interrupted current ranges.

The power distribution and generator protection application trip units are available in both 3 and 4-pole versions. With the XT2, XT4, XT5, XT6, XT7 and XT7 M versions the trip units are interchangeable, in order to make a performance upgrade of the system easier.

Thermal-magnetic trip unit

Overview

The thermal-magnetic trip units are used for the protection of AC and DC networks. They are a solution for systems where only protection against overloads and short-circuits are needed.

Power Distribution Protection

- TMF
- TMA

Motor Protection

- MA

- Key:
1. Current threshold for short-circuit protection;
 2. Rotary switch for short-circuit protection;
 3. Current threshold for overload protection;
 4. Rotary switch for overload threshold setting.

Rotary switch

Depending on the version, it is possible to set the desired thresholds for protection by turning the front rotary switch.

Ekip Dip

Overview

The Ekip Dip is a first level of electronic trip unit, used for the protection of AC networks.

Power Distribution Protection

- Ekip Dip LS/I
- Ekip Dip LIG
- Ekip Dip LSI
- Ekip Dip LSI G

Motor Protection

- Ekip M Dip I
- Ekip M Dip LIU

Generator Protection

- Ekip G Dip LS/I

Key:

1. Dip switches for an overload protection setting.
2. Dip switches for short-circuit and time delayed short-circuit protection settings.
3. Slot for lead seal.
4. Test connector.
5. Power-on LED.

Dip switches

The dip switches on the front of the trip unit allow manual settings also when the trip unit is off.

LEDs

The LEDs on the front indicate the status of the release (on/off) and provide information about the protection tripped when the Ekip TT accessory is connected.

Front connector

The connector on the front of the unit allows the connection of:

- Ekip TT for trip testing; LED-test and signaling of the most recent trip.
- Ekip T&P for connection to a laptop with the Ekip Connect program (thus measurement reading, as well as trip and protection function tests are made available for the user).

Characteristics of electronic Ekip Dip trip units

Operating temperature	-25°C...+70°C
Relative humidity	98%
Self-supplied	0.2xIn (single phase)*
Auxiliary supply (where applicable)	24V DC ± 20%
Operating Frequency	45...66Hz
Electromagnetic compatibility	IEC 60947-2 Annex F

*For 10A:0.4in

Thermal memory

All the Ekip Dip trip units include a thermal memory function. The trip unit records the trips which have occurred in the last few minutes. Since the trip causes overheating, in order to protect the cables and let them cool down, the trip unit imposes a shorter delay tripping time in case of a fault. Thus, the system is protected against damage due to cumulative overheating. This can be disabled, if needed, by using the Ekip T&P.

External neutral

Ekip Dip trip units are available in both 3 and 4 poles. The 3-pole version with earth fault protection (G) can be equipped with an external sensor for the neutral phase. In this way, the external neutral phase is protected and uninterrupted.

Communication

- Using the dedicated Ekip Com module, XT2 and XT4 can communicate with Modbus RTU when they are equipped with the following trip units:
 - Ekip LSI
 - Ekip LSI G.

Ekip Touch/Hi-Touch

Overview

The Ekip Touch/Hi-Touch provide a complete series of protections and high accuracy measurements of all electrical parameters and can be integrated perfectly with the most common automation and supervision systems.

Power Distribution Protection

1. Power-on LED; pre-alarm LED; alarm LED
2. Test and programming connector
3. Display
4. Home push-button to return to homepage;
5. Push-button for testing and tripping information

Communication and Connectivity

The Ekip Touch/Hi-Touch trip units can be integrated perfectly into all automation and energy management systems to improve productivity and energy consumption and for remote control. The circuit-breakers can be equipped with communication modules for Modbus, Profibus, and DeviceNet™ protocols as well as Modbus TCP, Profinet and EtherNet/IP™. The modules can be easily installed even at a later date.

A solution with integrated modules is useful when the space in the switchboard is limited, but also a solution with external Ekip Cartridge modules is highly suitable when an advanced control and communication system is required.

Furthermore, the IEC61850 communication module enables connection to automation systems widely used in medium voltage power distribution to create intelligent networks (Smart Grids). All circuit-breaker functions are also accessible via the Internet, in complete safety and through the Ekip Link switchgear supervision system. Furthermore, with an easy connection thanks to the Ekip Com Hub module, the circuit-breakers allow the system to be monitored via ABB Ability™ Energy and Asset Manager.

Ekip Touch/Hi-Touch

Overview

Efficiency and measurements

Achieving maximum efficiency for an electrical installation requires intelligent management of power supplies and energy use. For this reason, the new technologies used in the Ekip Touch/Hi-Touch trip units allow the productivity and reliability of installations to be optimized while reducing consumption and fully respecting the environment. These advanced functionalities, together with the protection and communication functions contribute to make Tmax XT with Ekip Touch/Hi-Touch the circuit-breaker that maximizes efficiency in all low-voltage electrical installations. With 1% accuracy on power and energy measurements, the trip units are certified according the IEC 61557-12 Standard. Ekip Touch/Hi-Touch trip units are no longer simply protection devices, but integrate multimeter and network analyzer functionality, thus guaranteeing a top level energy management system.

Digital Upgrade

Ekip Touch/Hi-Touch trip units are available in different versions, to enable a wide range of functions: from the Ekip Touch to the Ekip Hi-Touch, it is always possible to customize any device thanks to the additional digital modules.

All functions are available on the ABB Ability Marketplace™ and can be added both when ordering the trip unit as well as after the installation of the circuit-breaker. Ekip Connect provides the desired functions, and EPiC makes the operation even faster, directly from a Smartphone. Several packages are available to download, and all of them are designed to save time, costs, and space, since no external devices are needed.

Interface

It is possible to interact with the trip unit in several ways via:

- **The front display**

An LCD display with a push button ensures easy navigation on the XT2 and XT4, while a color touch screen is available for intuitive and quick navigation on the XT5 and XT7, together with the possibility of viewing the waveform for different parameters.

- **Smartphone via Bluetooth**

Thanks to the integrated Bluetooth functionality, it is possible to set and check all the measurements and information directly from a smartphone thanks to the EPiC app. Even when the cabinet door is closed, it is always possible to carry out maintenance in a safer way.

- **PC with Ekip Connect**

It is also easy to interact with the trip unit with a PC. Thanks to the Ekip T&P cable the trip unit can be easily connected to a USB PC port and using the Ekip Connect program it is possible to fully interact with the trip unit.

Supply

The Ekip Touch/Hi-Touch protection trip unit is self-supplied through the current sensors and does not require an external supply for the basic protection functions or for the alarm indication functions. The trip units for all the circuit-breakers start to power on from a minimum of $0.2 \times I_n^*$ and activate the indication functions, the ammeter and the display. All protection settings are stored in a non-volatile memory that maintains the information, even without a power supply. An auxiliary supply can also be easily connected. In fact, the trip unit can be supplied by means of a galvanically isolated 24V DC auxiliary voltage with the following characteristics:

Parameter	Operation limits
Voltage	24 V DC galvanically isolated*
Tolerance	±10%
Maximum wave	±5%
Maximum surge current @ 24 V	10 A for 5 ms
Maximum rated power @ 24 V	4 W
Connecting cable	Insulated with ground cable (characteristics equal to or greater than Belden 3105A/B)

The the insulation characteristics must refers to the IEC 60950 (UL 1950) or their equivalent

The Ekip Supply module can be connected to both DC and AC current power supplies to activate additional functions such as:

- using the unit with the circuit-breaker open;
- using additional modules such as Ekip Signalling and Ekip Com;
- connection to external devices such as Ekip Multi-meter;
- recording the number of operations;
- G protection with values below 100A or below $0.2 \times I_n^*$;
- zone selectivity;
- Gext and MCR protection functions.

Supply	Ekip Supply	
Nominal voltage	24-48 V DC	110-240 V AC/DC
Voltage range	21.5-53 V DC	105-265 V AC/DC
Rated power (including modules)	10W max.	10W max.
Inrush current	~10A for 5 ms	~10A for 5 ms

The Ekip Touch/Hi-Touch are also supplied with a battery that enables the cause of the fault to be indicated after a trip. In addition, the battery enables the date and time to be updated, thus ensuring the chronology of events. When the Ekip Touch/Hi-Touch are active, they use an internal control circuit to automatically indicate that the battery is flat. Furthermore, when the unit is switched off a battery test can be run by simply pressing the iTest key.

* for XT2 and XT4 with $I_n \leq 100A$: $0.3 \times I_n$

Ekip Touch/Hi-Touch

Overview

Rating Plug

The XT5 and XT7 trip units allow the rated current to be modified by simply changing the front rating plug. Thus, an upgrade of the circuit-breaker, whenever needed, can be carried out without replacing the circuit-breaker.

Commissioning

The setting, testing and downloading of reports can be carried out directly from a smartphone, tablet or PC. In addition, the commissioning stage can be further accelerated, minimizing the possibility of errors, by directly configuring the protection trip unit with the DOC design software settings.

Test function

The test port and the iTest key on the front of the protection unit can be used to carry out circuit-breaker tests by connecting one of the following devices:

- The Ekip TT, which allows trip tests, LED tests and checks for the absence of alarms detected by the watchdog function;
- The Ekip T&P, which permits not only trip tests and LED tests but also testing of the individual protection functions and the saving of the relative report;
- The iTest key, to run a battery test when the circuit-breaker is disconnected.

The following table shows the main features for each version of the trip unit. The additional features can be added to the trip unit at the time of purchase or after, via the ABB Ability Marketplace™.

Watchdog

All the Ekip Touch/Hi-Touch trip units for the Tmax XT ensure high reliability thanks to an electronic circuit that periodically checks the continuity of the internal connections, such as the trip coil, rating plug and each current sensor (ANSI 74). In the event of an alarm, a message is shown on the display, and if it is set during the installation phase, the trip unit can command the opening of the circuit-breaker. If a protection function intervenes, Ekip Touch/Hi-Touch always checks that the circuit-breaker has been opened by auxiliary contacts that indicate the position of the main contacts. Otherwise, Ekip Touch/Hi-Touch indicate an alarm (ANSI BF code Breaker Failure) to command the opening of the circuit-breaker upstream. Ekip Touch/Hi-Touch also feature self-protection, which ensures the correct operation of the unit in overtemperatures (OT) inside the protection trip unit.

The following indications or controls are available:

- “Warning” LED for temperature below -20 °C or above +70 °C, at which point the trip unit operates correctly with the display switched off.
- “Alarm” LED for temperature outside the operating range, at which point the trip unit commands the opening of the circuit-breaker (if set during the configuration phase).

Ekip Touch/Hi-Touch

Protection functions

The Ekip Touch/Hi-Touch trip units enable all the protection functions to be set with a few simple steps.

Thanks to the ABB Ability Marketplace™, it is always possible to customize the Ekip Touch/Hi-Touch trip units when ordering and also when the circuit-breaker is already installed by using the Ekip Connect 3.

Each trip unit has a default protection set, as shown in the table below. Adding other functional packages to this set is always possible, either directly when ordering the circuit-breaker, or via ABB Ability Marketplace™ at a later time.

The following protection software packages are available to be added to any version of Ekip Touch/Hi-Touch trip units:

- Voltage Protection
- Voltage Protection Advanced
- Frequency Protection
- Power Protection
- ROCOF Protection
- Adaptive Protection

Ekip Touch/Hi-Touch

Protection functions

The Ekip Touch/Hi-Touch can be customized with the protection functions required.

L – Overload (L - ANSI 49)

This function is used for protection against overloads. It allows the setting of the trip threshold, trip time and pre-alarm threshold. Three different types of trip curves are available:

1. $t = k/I^2$ with an inverse long time;
2. IDMT in accordance with IEC 60255-151 for coordination with medium voltage protection, available according to Standard Inverse (SI), Very Inverse (VI) and Extremely Inverse (EI) curves;
3. With a $t = k/I^4$ curve for better coordination with upstream circuit-breakers or fuses.

S – Time-delayed overcurrent (S - ANSI 51 & 50TD)

This function is used to protect against selective short-circuits. If necessary, it can be disabled, or if needed, only the trip can be excluded keeping the alarm indication, to be used in installations where continuity of service is required. With a constant trip time ($t = k$), or constant specific let through energy ($t = k/I^2$).

I – Short-circuit

This function is used for instantaneous protection against short-circuits. The trip threshold is adjustable and, if needed, the protection can be disabled.

G - Ground fault

This function protects against earth faults. The trip threshold and trip time are adjustable. When needed, the protection can be disabled.

Neutral protection

This function is used to adjust the setting provided from protections L, S and I on the Neutral pole with a control factor which is different from the other phases. It is available with values at 50%, 100%, 150% or 200% of the phase currents. It can be disabled if necessary.

2I - Second protection against instantaneous overcurrent

This function protects against the instantaneous short-circuit (e.g. I protection) and it is enabled with an activation event (or command), that can be programmed by the user. It can be activated for different uses in three ways:

- locally, directly on the Ekip display unit
- locally, with a smartphone with the EPiC app via Bluetooth
- locally, with a PC with the Ekip Connect program
- remotely, via any Ekip Com module connected to the circuit-breaker
- remotely, via a switch wired through an Ekip Signalling module.

When active, the Ekip display unit will show a confirmation of the activation and a red LED alarm will flash on the diagnosis bar.

Moreover, the second instantaneous tripping curve (also referred to as RELT - Reduced Energy Let-Through) is designed to mitigate arc flashes. This protection can be adjusted from 1.5 to 15 x I_n with a maximum setting of 18kA. Easy activation and I/O assignment, including positive feedback, can be established using the RELT Ekip Signaling 2k-3 module.

MCR – Closing on Short-circuit

This protection uses the same algorithm as the I protection, limiting the operation to a settable time window starting from the closing of the circuit-breaker. The protection can be disabled, when needed. The function is active with an auxiliary supply.

linst

This guarantees the integrity of the circuit-breaker and installation in the case of particularly high current values requiring shorter reaction times than those provided by the instantaneous short-circuit protection. The protection cannot be disabled, and the tripping threshold and time are defined by ABB.

IU - Current unbalance (ANSI 46)

This function protects against an unbalance between the currents of the single phases protected by the circuit-breaker.

Harmonic distortion

This allows a control alarm to be activated for a distorted waveform. If enabled, an alarm is activated for waveform factors higher than 2.1.

T - Temperature

This protects the circuit-breaker against abnormal temperatures recorded by the unit. It is always active, and has two states, according to the temperature:

- Warning: $-25 < t < -20$ or $70 < t < 85$ Display off; Warning LED on @ 0.5Hz.
- Alarm: $t < -25$ or $t > 85$ Display off; Alarm and Warning LEDs on @2Hz; Circuit-breaker opening command.

Hardware Trip

This protects against internal disconnections of the circuit-breaker. If enabled, a fault is signaled and an opening command is sent if one or more of the following events are detected:

- Current sensors disconnected (phase or external if enabled)
- Rating plug disconnected (only for XT5 and XT7)
- Trip coil disconnected (only signaling)
- Incompatibility between protection release and mainboard (only for XT7)
- Internal problems with the release.

Current thresholds

This function enables the realization of four independent thresholds to be indicated to enable corrective actions before the overload L protection trips the circuit-breaker. For example, by disconnecting the loads controlled by an Ekip Signalling device positioned downstream of the circuit-breaker.

Ekip Touch/Hi-Touch

Protection functions

S2 - Second time-delayed overcurrent protection

In addition to the Standard S protection, a second (excludible) time-constant protection is available that enables two independent thresholds to be set to ensure precise selectivity, especially under highly critical conditions.

Phase sequence

This function gives an alarm in case of phase sequence inversion.

UV - Undervoltage (UV - ANSI 27)

With a constant trip time ($t = k$), this trips when the phase voltage falls below the set threshold.

OV - Overvoltage (OV - ANSI 59)

With a constant trip time ($t = k$), this trips when the phase voltage exceeds the set threshold.

UV2 & OV2 - Second protection against undervoltage and overvoltage (ANSI 27 and 59)

This enables two minimum and maximum voltage thresholds to be set with different delays to discriminate, for example, between voltage dip transients due to the start-up of a motor and an actual fault.

VU - Voltage unbalance (VU - ANSI 47)

With a constant trip time ($t = k$), this protects against an unbalance between the voltages of the single phases that are protected by the circuit-breaker.

S(V) - Voltage controlled overcurrent protection (ANSI 51V)

This provide protection from a maximum current with a constant trip time ($t = k$) that is sensitive to the voltage value. Following a voltage drop, the current set threshold decreases in steps or linearly. It is possible to set the operating mode to: active, alarm only, or deactivated. The protection operates also with the circuit-breaker open, thus allowing fault identification before circuit-breaker closing.

In step mode (controlled mode) the protection is tripped at a set threshold (I_{20}) if the voltage is above U , whereas it is tripped at the lower threshold of the factor K_s ($I_{20} * K_s$) if the voltage is below U .

In linear mode (restrained mode) two voltage limits are selected within which the protection is tripped at the set threshold (I_{20}) reduced by a factor of K corresponding to the measured voltage. The variation of the factor K is proportional to the voltage, and for voltages greater than the upper threshold (U_h) the threshold I_{20} works, whereas for voltages below the lower threshold (U_l) the minimum threshold ($I_{20} * K_s$) applies.

S2(V) – 2nd protection against voltage-controlled overcurrent protection (ANSI 51V)

Available in addition to the protection $S(V)$, this enables total selectivity to be achieved in all installations. It is possible to set the operating mode to: active, alarm only, or deactivated. The protection also operates with the circuit-breaker open, thus allowing fault identification before circuit-breaker closing.

Residual overvoltage (ANSI 59N)

With a constant trip time ($t = k$), this protects against insulation loss in systems with insulated neutral or with neutral earthed with impedance. It is possible to set the operating mode to: active, alarm only, or deactivated. The protection also operates with the circuit-breaker open, thus allowing fault identification before circuit-breaker closing.

UF Underfrequency (ANSI 81L)

With a constant trip time ($t = k$), this trips when the network frequency falls below a set threshold.

Ekip Touch/Hi-Touch

Protection functions

OF Overfrequency (ANSI 81H)

With a constant trip time ($t = k$), this trips when network frequency exceeds a set threshold.

UF2 & OF2 Second protection against underfrequency and overfrequency (ANSI 81L and 87H)

This enables two minimum and maximum frequency thresholds to be set simultaneously. For example, just an alarm can be set for tripping when the first threshold is reached, and the circuit-breaker can be set to be opened when the second threshold is reached.

RP Reverse active power

With a constant trip time ($t = k$), this trips when the total active power – in the opposite direction of the current – exceeds the set threshold.

Cos ϕ Power factor

Available with a three-phase threshold, this provides a warning when the system operates with a power factor that is lower than the set power factor.

D Directional overcurrent

This form of protection is able to recognize the direction of the current during the fault period and thus detect if the fault is upstream or downstream of the circuit-breaker. The protection, with a fixed time trip curve ($t=k$), intervenes with two different time delays ($t7bw$ and $t7fw$), according to the current direction. In ring distribution networks, it enables the identification and disconnection of the area in which a fault has occurred, while maintaining operation in the rest of the installation.

Zone selectivity for protection D

This enables the possibility to interconnect more circuit-breakers, so that, in case of a fault, the affected area can be disconnected nearest to the fault and operation in the rest of the installation is maintained. It is possible to enable directional zone selectivity alternatively to zone selectivity of S and G protections. This also works in the presence of an auxiliary supply.

Start-up function for protection D

This enables higher trip thresholds to be set at the outgoing point, as available for protections S, I and G.

RQ Loss of field or reverse reactive power (ANSI 40 or 32RQ)

With a constant trip time ($t = k$) this circuit-breaker trips when the total reactive power absorbed by the generator exceeds the set threshold. It is possible to select a constant threshold ($k=0$) or a function of the delivered active power of the generator ($k \neq 0$).

OQ Reactive overpower (ANSI 32OF):

With a constant trip time ($t = k$), this trips when the reactive power exceeds the set threshold in the direction from the generator to the network.

OP Active overpower (ANSI 32OF):

With a constant trip time ($t = k$), this trips when the active power exceeds the threshold set in the delivering direction from the generator.

UP Active underpower (ANSI 32LF):

With a constant trip time ($t = k$), this trips when the active power delivered by the generator is lower than the set threshold. It is possible to disable the protection temporarily to manage the start-up phase by setting a time window from the closing of the circuit-breaker, by using an electric signal or via incoming communication to a relay.

RQ2 Second protection against loss of field or reverse reactive power (ANSI 40 or 32R):

This functions as the above mentioned RQ protection. These two functions can be active and used at the same time, thus allowing the under-excitation curve of the generator to be accurately followed and avoiding unwanted disconnections.

ROCOF Rate of change of frequency (ANSI 81R)

This enables both positive and negative frequency variations to be detected rapidly. The threshold is constant and the function trips when the frequency variation in Hz/s is greater than the set threshold. It is possible to set the operating mode to: active, alarm only, or deactivated. The protection enables the identification and disconnection of the area where the fault has occurred while maintaining operation in the rest of the installation.

Ekip Touch/Hi-Touch

Protection functions

Adaptive protection: dual setting of protections (Set A-B)

The Ekip Hi-Touch can store a set of alternative parameters (set B) for all protections. This second set can replace the default series (set A) with an external control. A typical application for dual settings may be when an emergency source is activated in the system, causing a change of load capacity and short-circuit levels, and in cases of switchgear maintenance to protect the operator against electric arcs (the minimum trip delays of set B guarantee safety for the operator). It is possible to activate series B by:

- Digital input, available with an Ekip Signalling module;
- Communication network, by means of one of the Ekip Com communication modules;
- Directly from the Ekip Hi-Touch display;
- Using a settable internal time, after the circuit-breaker has closed.

L Motor protection overload in compliance with Standard IEC 60947-4-1 Table 2

The L function protects the motor against overloads in accordance with the indications and classes defined by Standard IEC 60947-4-1 and the Table 2. The trip time is established by choosing the appropriate trip class, which depends on the motor that must be protected. In addition to this protection, the thermal memory function (implemented in accordance with Standard IEC60255-8 and the above-mentioned Standard) is permanently activated. After tripping the Ekip M Touch LRIU, the thermal memory is active for a time that depends on the trip class selected (see table). The protection unit will trip faster than the time established for a cold fault condition if a new overload occurs before the thermal memory automatically resets (hot trip condition). The protection has a “start-up” stage from the moment the current exceeds $0.25 \times I_n$ to the moment the minimum time of the selected trip class is reached.

TRIP CLASS	CLASS MIN	CLASS MAX	TMEM RESETTING TIME
5E	3s	5s	5 min
10E	5s	10s	10 min
20E	10s	20s	20 min
30E	20s	30s	33 min

R Protection against rotor blockage

This protects the motor in two different ways, depending on whether the fault occurs on startup or during normal operation. The behavior in the two operating conditions is defined by the Standard IEC 947-4-1 in Annex 2. In the first case (Jam), the operation of the R function protects the motor against rotor jamming during normal operation. The R (Jam) protection function works in conjunction with the L protection to ensure that the motor start-up phase is completed. The R (Jam) protection is inhibited during the start-up phase for the same time as the minimum time in the selected overload protection trip class. Once this time has elapsed, the R protection is activated and causes the circuit-breaker to trip if the current remains above the current threshold setting (I_5) for longer than the time (t_5) setting of the protection. In the second case (Stall), the protection is designed to operate to protect the motor against rotor jamming upon start-up. If activated, the R (Stall) protection is not inhibited during start-up and causes the circuit-breaker to open if the current remains above the current threshold setting (I_8) for longer than the time setting (t_8) of that protection. The protection has a “start-up” stage from the moment the current exceeds $0.25 \times I_n$ to the moment the minimum time of the selected trip class is reached.

U Protection against phase loss and/or unbalance

This can be implemented when the motor must be promptly protected owing to the absence of a phase. The protection trips if the r.m.s. value of at least one of the phase currents drops below the level equal to 0.1 times the rated current of the trip unit and a second phase exceeds 0.25 times the rated current.

The circuit-breaker is opened if the current value fails to rise above this level within 2 sec. During start-up, the tripping time of the protection is the lowest value between 2 sec or half the minimum time of the start-up class. The protection has a “start-up” stage starting from the moment the current exceeds $0.25 \times I_n$ to the moment the minimum time of the selected trip class is reached.

UC Undercurrent protection

This function protects the motor from operating in conditions where the load is reduced or null. The circuit-breaker is opened if all the phases remain below the threshold setting I_9 for delay-time t_9 . The protection has a “start-up” stage from the moment the current exceeds $0.25 \times I_n$ to the moment the minimum time of the selected trip class is reached.

IU Protection against phase unbalance

This unit is used when a motor needs to be protected against differences in the currents circulating in the phases. Threshold setting I_7 defines the maximum level of difference between each phase and the mean value of the three phases. If a phase differs more than its set level from the mean value, the protection opens the circuit-breaker once its time-delay setting (t_7) has elapsed. The protection is activated only if all three phase currents exceed $0.25 \times I_n$. During the start-up phase, the tripping time is the lowest value between t_7 or half the minimum time of the start-up class. The protection has a “start-up” stage from the moment the current exceeds $0.25 \times I_n$ to when the minimum time of the selected trip class is reached.

PTC Temperature protection

In its initial configuration, this trip unit is set up to receive an incoming signal from a PTC sensor installed on the motor. The operating thresholds of the protection are defined in accordance with the Standard IEC 60947-8. If the threshold is exceeded, the trip unit opens the circuit-breaker after a 1 sec time-delay.

Ekip CI Contactor Interface for motor protection

The breaking capacity of a contactor is definitely lower than a circuit-breaker, but with a number of possible operations consistently higher than those of the breaker (approx. 1,000,000): motor protection and operation are thus optimized when these two devices are used in conjunction with each other. In its initial configuration, the trip unit is set for operation in Normal mode, activating the contactor by means of the Ekip CI module if one of the protections trip (with the exception of protections I and G).

If the configuration is changed from Normal to Heavy, the trip unit opens the circuit-breaker directly without transmitting the command to the contactor. An auto-reset function allows the actuation status of the Ekip CI to reset automatically after the contactor has tripped owing to the L function, once an adjustable time from 1 to 1000s has elapsed. Auto-reset can occur only in Normal mode. A BACK UP function is also available and deals with situations where an opening command transmitted to the contactor via module Ekip CI has not been successful. In this case, the EKIP M Touch LRIU trip unit sends an opening command to the circuit-breaker after waiting for the set time T_x . The actuation time of the contactor given by the manufacturer must be considered when the time-delay setting T_x is entered. The function is active with an auxiliary supply.

Ekip Touch/Hi-Touch

Protection functions

SC Synchrocheck

By comparing voltage, frequency and phase values of the two circuits involved, the synchronism control function indicates that the synchronism conditions necessary to allow the circuit-breaker to be closed have been reached. The function is available in two operating modes:

- In systems with both busbars supplied, where synchronism is determined by:

1. the voltage of the two half-busbars above the U_{live} threshold for the set time
2. the difference of the two voltages below the threshold ΔU
3. the difference of the frequency of the two voltages below the threshold Δf
4. the difference of the phase of the two voltages below the threshold Δ
5. the desirable time for synchronism condition t_{syn}
6. the circuit-breaker.

- In systems with an out-of-service line (dead busbar), where the synchronism condition is determined by the concurrence of the following conditions for the set t_{Ref} time:

1. the voltage of the active half-busbar is above threshold U_{live}
2. the voltage of the dead half-busbar is below threshold U_{dead}
3. the circuit-breaker is open.

In both cases, the synchronism signal is activated when the required conditions are reached and it remains active for at least 200ms. After this lapse of time, the consent signal is deactivated, if the synchronism conditions fail.

The indication of the synchronism reached is available directly as an electrical indication via a contact that is always provided with the module. This function can be activated simply by connecting the Ekip Synchrocheck module to any Ekip Touch device provided with an Ekip Measuring module.

G ext – Ground fault on toroid

This is available only for the XT7, with a trip time which is independent of the current ($t = k$) or with a constant specific let-through energy ($t = k/I^2$). If the pre-alarm reaches a 90% threshold this permits the fault to be reported to supervision systems without any interruption of continuity. The protection needs an external toroid installed, for example, on the star center of the transformer, and is an alternative to the G and Rc functions. This device works with an auxiliary supply.

Modified differential ground fault (MDGF)

With trip time independent of the current ($t = k$) or with constant specific let-through energy ($t = k/I^2$). The protection allows use of the MDGF scheme into the XT7 circuit-breaker. Third party phase current transformers and summing current transformers are needed to realize the complete scheme. XT7 needs a dedicated terminal in order to properly measure the ground fault (see the paragraph "Modified differential ground fault terminals" in the "Ordering codes" chapter).

RC Residual current

This is available only for the XT7, with a constant time ($t=k$) and protects against indirect contacts and is integrated into the Ekip Touch LSIG with an Ekip Measuring with a dedicated residual current rating plug and external toroid. The protection is an alternative to the G and Gext functions.

Second protection against ground fault

This is available only for the XT7. Whereas with the Ekip Touch, the user has to choose between implementation of the G type protection using internal current sensors (calculating the vector sum of the currents) or Gext external toroids (direct measurement of the ground fault current), the Ekip Hi-Touch offers the exclusive feature of simultaneous management of both configurations by two independent ground fault protection curves. Owing to this characteristic, the trip unit is able to distinguish a non-restricted from a restricted ground fault, and then activate the opening of the circuit-breaker and command the opening of the medium voltage circuit-breaker. Another possible configuration is with the residual current protection replacing the Gext protection, while the G protection remains active. The residual current protection is activated in the presence of the residual current rating-plug and of the toroid.

RC Differential ground fault protection against ground faults

Available on the XT7 only, this unit protects against internal ground faults on the generator windings. It is required that the toroid (additional accessory) embraces the active conductors and the ground conductor. RC protection is integrated via a dedicated residual current rating plug and an external toroid.

Thermal memory

This function is used to protect components such as transformers and cables against overheating due to overloads. It adjusts the trip time of the protection according to the time elapsed after the first overload, taking account of the overheating caused. It can be activated when a $t = k/I^2$ (with an inverse long time) curve is used.

Trip Enable

The function enables the trip to be excluded so that only the alarm is indicated. This is used in installations where continuity of service is an essential requirement.

Zone Selectivity

The function allows multiple circuit-breakers belonging to the same installation to be connected together, in order to coordinate the trip units and to reduce the tripping times in the case of protections S, G, S2 and I. Thus, in the event of a failure:

- the circuit-breaker closest to the fault trips
- the other circuit-breakers are locked for a programmable time.

Each circuit-breaker that detects a fault reports it to the circuit-breaker upstream; the circuit-breaker that detects the fault but does not receive any communication from those downstream opens without waiting for the set delay to elapse.

It is possible to enable zone selectivity if a fixed-time curve has been selected and the auxiliary supply is present.

StartUp Enable

The function modifies the threshold of the protection for a period that can be set by the user, avoiding unwanted trips due to high inrush currents of certain loads (motors, transformers, lamps). The starting phase lasts 100ms to 30s and is recognized automatically by the trip unit:

- at the closing of the circuit-breaker with a self-supplied trip unit;
- when the peak value of the maximum current exceeds the set threshold ($0.1...10 \times I_n$) with an externally supplied trip unit.

A new start-up is possible after the current falls below the threshold. This function can be activated with a fixed time protection function ($t = k$). Moreover, the I3 startup threshold must be higher than the I2 startup threshold.

Protection blocks

With the Ekip Connect software, six blocks are available for some protections, which is useful for deactivating the protection based on programmable events. In particular:

- four blocks are associated with the programmable states A, B, C and D
- one block is associated with the start-up (present for protections that have a StartUp function);
- one block, not present for frequency protections, is associated with the checking of the measured frequency.

Each block is independent and has its own activation command. The protection is deactivated for a time equal to the duration of the event itself:

- if the programmed event occurs (true), in the case of state-based blocks
- if the StartUp function is active and the start-up threshold is exceeded (the active block for the set start-up time), whenever the StartUp block function is enabled.
- if at least one frequency measured is outside the range 30...80 Hz, in the case of a frequency based block.

Directional Zone Selectivity

The Zone Selectivity function allows multiple circuit-breakers belonging to the same installation to be connected together in order to coordinate the trip units and reduce tripping times, but with some important differences:

- it is to be used in installations with a ring circuit
- it allows tripping to be managed and coordinated according to the power flows (determined by the direction of the current), in order to minimize dispersion of energy.

It works as an alternative to S and G Zone Selectivity.

The RC for the XT7 is active only when the rating plug is present. All of the Synchrocheck functions are for signaling.

An adjustable pre-alarm threshold (50...90%) is available for L protection, as well as a fixed pre-alarm threshold is available for G and Gext protection.

(1) With Vaux all thresholds are available. Without Vaux there are minimum threshold limitations. Details available on the "User manual for use and maintenance of Ekip Touch Trip units"

(2) Available for XT7 only.

Rc	64 50N TD 87N	Residual current / Differential ground fault	- 20% ÷ 0%	140ms @ max trip time 950ms @ max trip time

(1) 2I Trip time with Vaux only:

- ≤ 3ms when the fault current is above 18kA

- ≤ 7ms (three-phase) or ≤ 9ms (single-phase) when the fault is greater than three times the 2I setting (I31)

- ≤ 15ms when the fault is lower than three times the 2I setting (I31)

(2) Available for XT7 only

The tolerances above apply to trip units already powered by the main circuit with current flowing in at least two phases or an auxiliary power supply.
In all other cases the following tolerance values apply:

ABB Code	Trip threshold	Trip time
L	Trip between 1.05 and 1.2 x I ₁	± 20%
S	± 10%	± 20%
I	± 15%	≤ 60ms
G	± 10%	± 20% (60ms when t4=inst)
Other protection	± 15%	± 20%

Ekip Touch/Hi-Touch

Measurement functions and data

Currents

All the Ekip Touch/Hi-Touch trip units measure the RMS value of the instantaneous currents of the three phases and the neutral. There are two different levels of accuracy depending on the version (0.5% and 1%). In addition, also the minimum and maximum values recorded within an adjustable time interval are available.

Voltage

Instantaneous phase-to-phase and phase-to-neutral voltages can be measured. They are available at a 0.5% level of accuracy. In addition, the minimum and maximum values recorded within an adjustable time interval are available.

Power

Real time measurements of the total and phase power. Available at 2 different level of accuracy depending on the version, 1 % and 2%. In addition, the minimum and maximum values recorded within an adjustable time interval are available.

Energy meters

Measurements of the active, reactive and apparent energy totals, updated every minute. The measurements can be reset when needed.

Frequency

Measurement of line real time frequency, expressed in hertz.

Peak Factor

Real time measurements of the peak factors of the phase currents. The measurements are expressed as a ratio between the peak values and RMS values, for each single phase.

Power Factor

Power factor and real time measurements of the ratio between the total active power and total apparent power, expressed as $\cos\phi$. In addition, the trip unit signals an alarm if the $\cos\phi$ value drops below an adjustable threshold, settable via Ekip Connect software (from 0.5 to 0.95).

Datalogger

This function allows the data related to a trigger event to be recorded. These data are:

- Analog measurements: phase currents and phase-to-phase voltages
- Digital events: protection alarms, circuit-breaker status signals, tripping of protections.

When the datalogger is activated, the trip unit continuously acquires data by filling and emptying an internal register. If a trigger event occurs, the trip unit inhibits acquisition (either immediately or with an adjustable time-lag) and stores the data, which is available for downloading.

Network Analyzer

This function fully evaluates the quality of the network. It is possible to set the controls to long cycle voltage and current in order to analyze the system functionality. Voltages and currents are monitored to find:

- The sequence of voltages
- Short term voltage drops or interruptions
- Short duration voltage increases
- Slow voltage drops
- Slow voltage increases
- Unbalances between the voltages
- Harmonic distortion of voltages and currents.

Waveforms

A selected quantity can be represented as a waveform and acquired at the moment of selection. The phase current and phase-to-phase voltage can be displayed.

Harmonics

A representation in the form of a histogram of the measurements of the harmonics that make up the waveform, and related to the frequency set.

Operation counter

In the presence of a power supply, the trip unit records information about the openings of the circuit-breaker including:

- the number of manual openings
- the total number of operations (manual + trips).

By activating communication with the trip unit, the following parameters are also available:

- the number of openings due to protection tripping
- the number of openings for which tripping has not been completed in due time (back-up commands have been necessary)
- the number of opening tests performed.

Contact wear

This gives an estimation of the conditions of the main circuit-breaker contacts. The value is expressed as a percentage, and is 0% in case of no wear, and 100% in case of total wear. This is calculated automatically by the trip unit at every opening for protection or, in the presence of a power supply, also at every manual opening of the circuit-breaker.

Openings

Information about the last 30 openings are available. In particular:

- tripped protection
- the progressive number of the opening
- the date and time of the opening (referred to the internal clock)
- measurements associated with the trip protection.

The most recent opening is viewable also by pressing the iTest key.

Events

The last 200 events are recorded. The following information is available:

- trip unit: configuration status of the bus, operating mode, active set, auxiliary power supply
- protections: delay in action or alarms
- connection states or alarms: circuit-breaker, current sensors, trip coil, rating plug
- tripping: state of the opening command, or signal of tripping for protection.

The icons help to quickly understand the type of event:

event reported for information purposes

delay of a protection in progress, trip expected

alarm referring to a non-hazardous condition

alarm for operation, failure, or connection fault.

Synchrocheck

Synchrocheck measurements relating to the function of synchronism between two independent power sources.

Ekip Touch/Hi-Touch

Measurement functions and data

The parameters measurable for each trip unit are shown in the following tables. Three different software packages are available to upgrade the trip units:

- Measuring package for measurement of voltage, power and energy
- Datalogger for data record
- Network Analyzer for the evaluation of the power quality.

Instantaneous measurements		Ekip Touch	Ekip Touch Measuring	Ekip Hi-Touch	Ekip M Touch	Ekip G Touch	Ekip G Hi-Touch

● Available as standard

○ Available as software package to be ordered via ABB Ability Marketplace™ or during the circuit-breaker ordering phase

Depending on the need, two different accuracy levels are available for the trip unit, the Standard Precision and High Precision certified according to IEC 61557-12:

Instantaneous measurements		Standard Precision	High Precision certified according to IEC 61557-12
Currents (RMS)	[A] L1, L2, L3, Ne	1%	0.50%
Ground fault current (RMS)	[A] I _g	2%	0.50%
Phase-to-phase voltage (RMS)	[V] U12, U23, U31	0.50%	0.50%
Phase-to-neutral voltage (RMS)	[V] U1, U2, U3	0.50%	0.50%
Frequency	[Hz] f	0.20%	0.20%
Active power	[kW] P1, P2, P3, P _{tot}	2%	1%
Reactive power	[kVAR] Q1, Q2, Q3, Q _{tot}	2%	2%
Apparent power	[KVA] S1, S2, S3, S _{tot}	2%	1%
Power factor	PF1, PF2, PF3, PF total	2%	1%
Active energy	[kWh] E _p total, E _p positive, E _p negative	2%	1%
Reactive energy	[kVARh] E _q total, E _p positive, E _p negative	2%	2%
Apparent energy	[kVAh] E _s total	2%	1%

The lowest current value that the trip units Ekip Touch/Hi-Touch can measure is 0.004 x I_n

High Precision certified according to IEC 61557-12

Available only for factory assembled circuit-breakers, this accuracy is available as default on the Ekip Hi-Touch and Ekip G Hi-Touch trip units; anyway, it is always possible to have this accuracy for the other Ekip Touch trip units by adding the dedicated commercial codes upon ordering.

For XT2 Ekip Touch trip units the High Precision is available in general for I_n ≥ 100A.

Measurement functions and data

Record of values: for each interval with time-stamping	Parameters	Window & interval
Current: minimum and maximum	[A] I Min, I Max	Fixed synchronizable
Phase-to-phase voltage: minimum and maximum	[V] U Min, U max	by remote
Active power: average and maximum	[kW] P Mean, P Max	Duration: 5...120min
Reactive power: average and maximum	[kVAR] Q Mean, Q Max	Number of intervals: 24
Apparent power: average and maximum	[KVA] S Mean, S Max	
Data logger: high rate sampling record of parameters	Parameters	
Currents	[A] L1, L2, L3, Ne, Ig	Fixed synchronizable
Voltages	[V] U12, U23, U31	by remote
Sampling rate	[Hz] 1200-9600	Duration: 5...120min
Maximum recording duration	[s] 18	Number of intervals: 24
Recording stop delay	[s] 0-10s	
Number of registers	[no] 2 independent	
Info on trip & opening data: after a fault without auxiliary supply	Parameters	
Type of protection tripped	eg. L, S, I, G, UV, OV	
Fault values per phase	[A/V/Hz w/VAR] eg. I1, I2, I3, neutral for S protection V12, V23, V32 for UV protection	
Time-stamping	Date, time and progressive number	
Maintenance indicators	Parameters	
Information on last 30 trips	Type of protection, fault values and time-stamping	
Information on last 200 events	Type of event, time-stamping	
Number of mechanical operations	[no] can be associated to alarm	
Total number of trips	[no]	
Total operating time	[h]	
Wear of contacts	[%] Pre-alarm >80% Alarm = 100%	
Date of maintenance operations performed	Last	
Indication of maintenance operation needed		
Circuit-breaker I.D.	Type of circuit-breaker, assigned device name, serial number	
Self-diagnosis	Parameters	
Check of continuity of internal connections	Alarm due to disconnection: rating plug, sensors, trip coil	Note: Opening of the circuit-breaker
Failure of circuit-breaker to open (ANSI 50BF)	Alarm following non-tripping of protection functions	can be set in the event of alarm
Temperature (OT)	Pre-alarm and alarm for abnormal temperature	

● Available as standard

○ Available as software package to be ordered via ABB Ability Marketplace™ or during the circuit-breaker ordering phase. To add this function, the Measuring package must be installed first.

Introduction

The Tmax XT circuit-breakers are fully ready for Industry 4.0 requirements. The increasing number of connected objects and people is transforming electrical installation systems, bringing forward new potential in efficiency and productivity.

The Ekip Touch trip unit series can be connected in several ways to different networks and systems. According to their complexity, the supervision of low-voltage systems may involve different levels. Depending on where the supervision is needed, different communication configurations are available.

Switchgear compartment: control of the main electrical values of the circuit-breaker and set the protection functions, thanks to:

- embedded display of the trip units
- Ekip Multimeter display connected to the trip unit
- smartphone connection via embedded Bluetooth.

Electrical switchgear: display of the data of all circuit-breakers installed in the switchgear from a single point, remotely and via several communication protocols. In this scenario, ABB Lite Panel, the front door display, allows monitoring and control of the circuit-breakers.

Electrical system: management of complex systems in which the devices must be integrated in automated industrial processes or in intelligent electrical networks, better known as smart grids.

The system can be supervised by:

- Ekip View software
- Internet with the ABB Ability™ Energy and Asset Manager webapp.

For all the possible supervision modes, connectivity modules are necessary. Two mounting solutions are possible, one excluding the other:

- **Internally**, it is possible to mount the Ekip Com modules in the circuit-breaker.

This solution can be used on XT2, XT4 and XT5 circuit-breakers. The module is mounted directly inside the circuit-breaker with no additional space needed in the switchboard.

For this configuration, dedicated internal module codes are available.

- **Externally**, through the Ekip Cartridge. The modules can be installed inside the cartridge, which is directly connected to the trip unit by a cable. Available with the XT2, XT4 and XT5 sizes. The Ekip cartridge is available in two versions depending on how many modules are needed.

The solution with the external cartridge permits a double or even triple communication channel, as well as redundant communication. Besides, the cartridge solution makes it possible the use of advanced functions, such as embedded ATS and more.

When an internal module is used, the Ekip Cartridge cannot be used and vice versa.

It has to be highlighted that, for the XT7 and XT7 M sizes, the modules must be installed directly on the terminal box available on the upper part of the circuit-breaker. The modules are the same of the Ekip Cartridge. On the upper part of the circuit-breaker it is possible to install one Ekip Supply plus maximum two additional modules.

Switchgear compartment

Display solutions

—
For the list of information available for each trip unit, see Chapter 3.

—
SACE Tmax XT circuit-breakers equipped with Ekip Touch/Hi-Touch electronic trip units enable electrical measurements and diagnostic data to be displayed on the front of the switchgear.

Solution with Ekip Touch trip units display

The Ekip Touch electronic trip units are the ideal solution for supervision and control of the compartments inside a switchgear. In detail:

- their use is simple and intuitive thanks to an embedded front display with push buttons on XT2 and XT4 sizes and a high resolution color touch screen display on XT5, XT7 and XT7 M sizes
- they do not require an auxiliary power supply for safety; the Ekip Touch trip units are directly supplied by the current sensors integrated in the circuit-breaker, thereby avoiding the use of external power supplies.

—
The Ekip Multimeter is a display unit to be installed on the front of the switchgear for SACE Tmax XT molded case circuit-breakers equipped with Ekip Touch electronic trip units.

Solution with Ekip Multimeter Display on the front of the switchgear

This device displays information about the system available in the trip unit to which it is connected and enables the adjustment of the parameters and protection thresholds.

The main characteristics of the Ekip Multimeter unit are:

- **Graphical and functional uniformity with the Ekip Touch trip units:** the Ekip Multimeter uses the same display as the trip unit to which it is connected, ensuring perfect continuity between the graphic display and the menu items.
- **Reduced dimensions:** the Ekip Multimeter guarantees the precision of the trip unit to which it is connected and performs the function of a measuring instrument without requiring the installation of external current and voltage transformers.
- **Flexible installation:** the Ekip Multimeter can be installed at a distance from the trip unit, enabling access to information from the most convenient point.
- **Simultaneous reading of the various electrical values:** the advanced connection system used allows several Ekip Multimeter devices to be connected to the same protection trip unit.

—
Embedded Bluetooth for a quick and wireless connection to your smartphone.

Solution with a smartphone connected via Bluetooth to the trip unit thanks to EPiC

Via the Ekip Connect App, it is possible to:

- check and modify the protection functions settings
- read the measurements available on the trip unit
- buy the functions to upgrade the trip unit from the ABB Ability Marketplace™ and enable them directly on the trip unit
- download and share test reports of the trip unit.

Electrical switchgear

Remote communication

The integration of low-voltage devices in communication networks is required, in particular for: automated industrial processes, industrial and petrochemical sites, modern data centers and intelligent electricity networks, better known as smart grids.

Ekip Com Modules

Thanks to the wide range of communication protocols supported, SACE Tmax XT circuit-breakers equipped with Ekip Touch/Hi-Touch electronic trip units can be integrated into communication networks without the need for external interface devices. The distinctive characteristics of the SACE Tmax XT circuit-breakers offering for industrial communication are:

- A wide range of protocols are supported; the Ekip Com communication modules enable integration with the most common communication protocols based on RS485 serial lines and the most modern communication systems based on EtherNet™ infrastructures, which guarantee an exchange of data in the order of 100 Mbit/s.

- Installation times reduced to a minimum due to the plug & play technology of the communication modules, which are connected directly to the circuit-breaker terminal box for XT7 and XT7 M and to the Ekip Cartridge with XT2, XT4 and XT5.
- Installation space reduced thanks to the ability to install the communication modules directly inside the circuit-breaker for XT2, XT4 and XT5.
- Redundancy of communication for greater reliability of the system; the circuit-breaker can be equipped with two communication modules at the same time, allowing the information on the buses to be exchanged simultaneously.
- Ready for the smart grid; the Ekip Com 61850 module is the solution for integrating SACE Tmax XT circuit-breakers into the automated systems of electrical substations based on the IEC 61850 Standard without the need for complex external devices.
- Complete supervision of Modbus RTU or Modbus TCP/IP networks via the software for PC Ekip View.

ABB Ability™ Edge Industrial gateway

This is a DIN-rail mounted communication module for cloud-connectivity. ABB Ability™ Edge Industrial gateway can collect data throughout the system from medium voltage to low voltage devices. Moreover, it is possible to connect sensors for environmental

parameters (temperature, water, gas) via both analog and digital inputs. Modules for Wi-Fi or cellular connection are provided as optional features. It now also has the possibility to run locally through a webserver dashboard without sending data to the cloud platform.

Electrical system

Software applications

ABB SACE offers software applications that allow the potential of the Ekip electronic trip units to be fully utilized in terms of the management of power, acquisition and analysis of the electrical values, and testing of the protection, maintenance in addition to carrying out diagnostic functions.

Overview of the software

An overview of the software available and the main characteristics are given below:

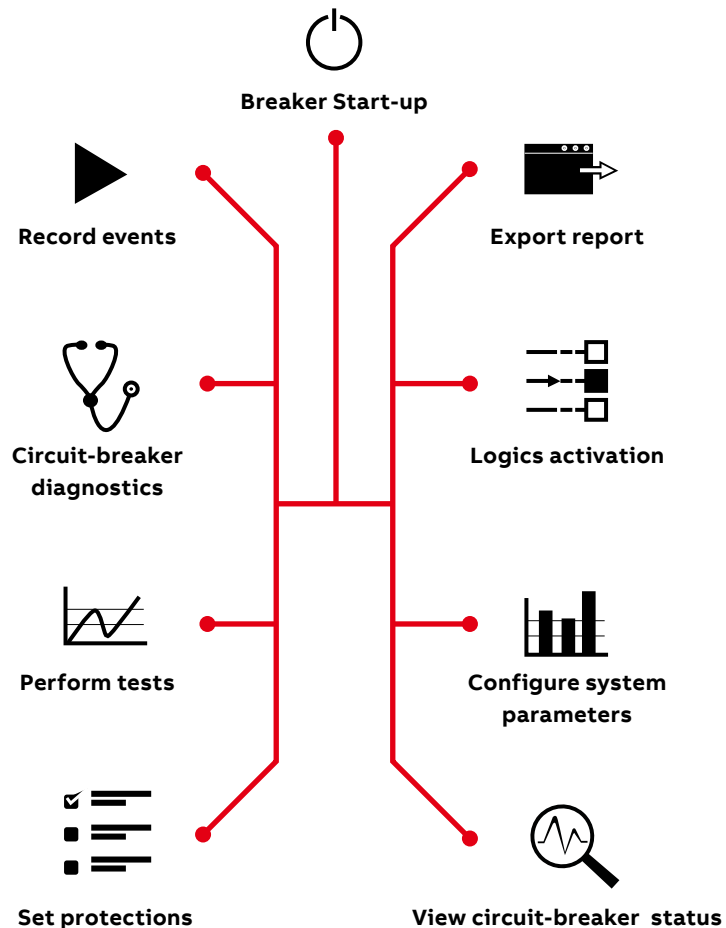

Software	Functions	Distinctive characteristics
Ekip Connect	<ul style="list-style-type: none"> - commissioning of circuit-breakers - fault analysis - communication bus testing 	<ul style="list-style-type: none"> - simple and intuitive use - integrated with DOC electrical design software - useable via EtherNet™ - automatic updating from the Internet - off-line mode - multi-media (smart phone, tablet or PC)
Ekip View	<ul style="list-style-type: none"> - supervision and control of communication networks - analysis of electrical value trends - condition monitoring 	<ul style="list-style-type: none"> - engineering free - analysis of past trends - customizable reports - access via Internet to the installation - possibility of integrating third party devices

Ekip Connect

Ekip Connect is the ABB programming and commissioning software tool that allows the user to unlock the full potential of circuit-breakers, improving the efficiency of the electrical plant.

A circuit-breaker is an essential part of any electrical system guaranteeing that day-to-day processes can be performed safely and continuously. For this reason, it is vital that the installation and use of the circuit-breaker is made as error-free and simple as possible. From commissioning to implementation, through monitoring, testing and analysis, Ekip Connect is the perfect tool for guiding the user in the management of ABB circuit-breakers throughout the entire product life cycle.

Ekip Connect is the ABB commissioning and programming software that allows the potential of Ekip electronic trip units to be fully realized. Using Ekip Connect, the user can manage power, acquire and analyze electrical values and test protection, maintenance and diagnostic functions. Just as SACE EMAX 2 did before, SACE Tmax XT has evolved into a true power manager that has simplified the electrical plant, and the Ekip Connect software has become the user's key to accessing the full capabilities of the breakers.

Electrical system

Ekip Connect

—
Panel builders
- 50% commissioning
time

Ease of use

Imagine you are a panel builder and you have to commission a circuit-breaker and you need to save time. Using Ekip Connect it is possible to cut commissioning time up to 50%. Providing a stress-free interaction with the device complexity, Ekip Connect easy-to-use software has all the answers.

Ekip Connect's simple and intuitive interface means that, from the very start, it is possible to easily navigate the tool and access every circuit-breaker operation. At a glance, the user can see all the required information, providing the ability to quickly and effectively assess any situation.

—
Facility managers
100% full exploitation
of the device

Full exploitation

Imagine you are a facility manager and you need to perform fast and precise diagnosis in order to keep everything under control and avoid failures. Using Ekip Connect you can exploit the full capabilities of your device and thanks to the customizable dashboard you can organize the functions displayed, just the way you want it. It is possible to manage all the circuit-breaker settings and specifications directly with Ekip Connect, making it the perfect instrument for exploring and using the breaker. Diagnostics are easy too: it is possible to consult and download the log of events, alarms and unit trips, thereby facilitating the identification and understanding of any anomalies.

This software is able to manage all ABB low-voltage circuit-breakers equipped with an electronic trip unit, providing full integration of air and molded case circuit-breakers.

—
Consultants/system
integrators
Complex logics at your
fingertips

Product enhancement

Imagine you are a consultant or a system integrator and you want to implement advanced features while avoiding the risk of errors. Using Ekip Connect it is possible to implement complex logics with a few clicks of your mouse.

Adding, setting and managing advanced functions has never been so easy.

Automatic transfer switch logics, load shedding, advanced protection and demand management can be managed and easily set via the Ekip Connect software.

Expand the software features by purchasing and downloading software packages for advanced functions directly using Ekip Connect.

Accessing the full potential of the circuit-breaker is finally possible. Thanks to Ekip Connect software, you can achieve complete utilization of the breaker and more with just a few clicks of your mouse.

Configuration

- Set protections
- Configure system and communication parameters
- Breaker start-up

Monitoring & analysis

- View circuit-breaker status and measurements
- Read events list
- Circuit-breaker diagnostics

Product implementation

- Set advanced protections
- Logics activation
- Enable advanced functions

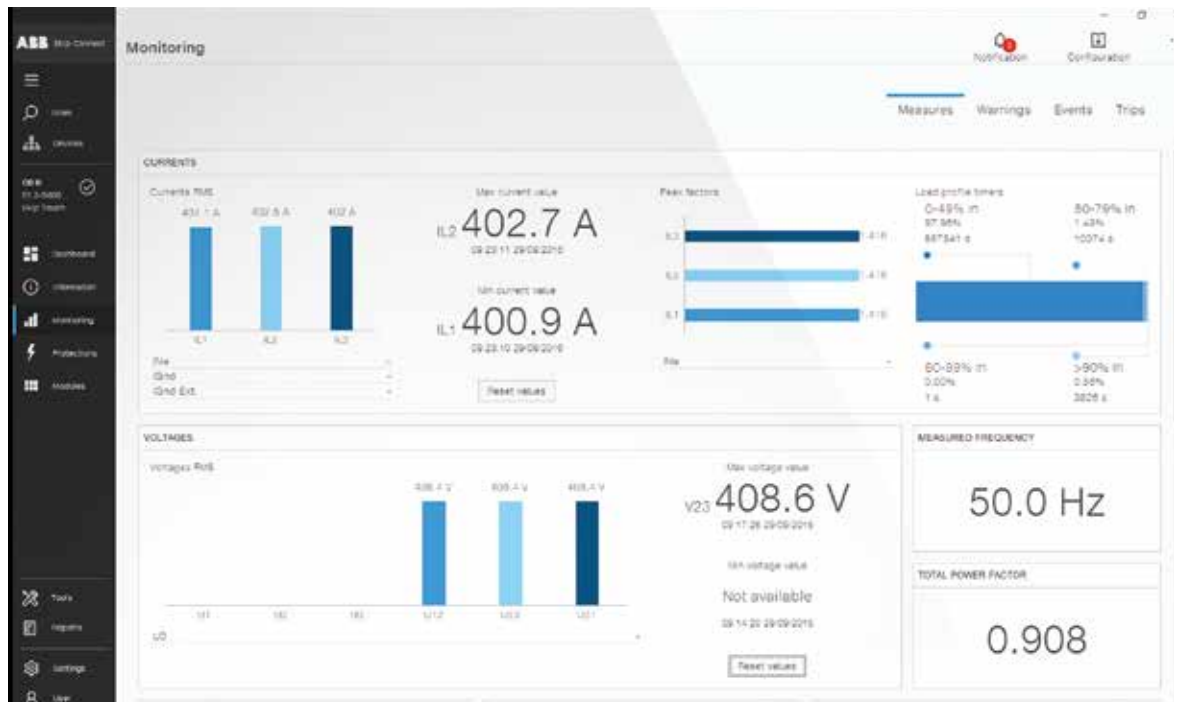

Test

Testing & reporting

- Check correct functionality
- Perform tests
- Export report

Ekip Connect is available for free download at <http://www.abb.com/abblibrary/DownloadCenter/>

EPiC

With Bluetooth embedded into the trip units it possible to connect rapidly to the EPiC app. Buy additional protection functions or measures, register the product and configure your device. EPiC helps the customer during the commissioning of the system; all system parameters and protection thresholds can be set rapidly in the Ekip Touch trip units thanks to the easy and intuitive navigation pages of the app.

Electrical system

Ekip View

Ekip View is the software for supervising all the devices connected to a communication network that uses the Modbus RTU or Modbus TCP protocol.

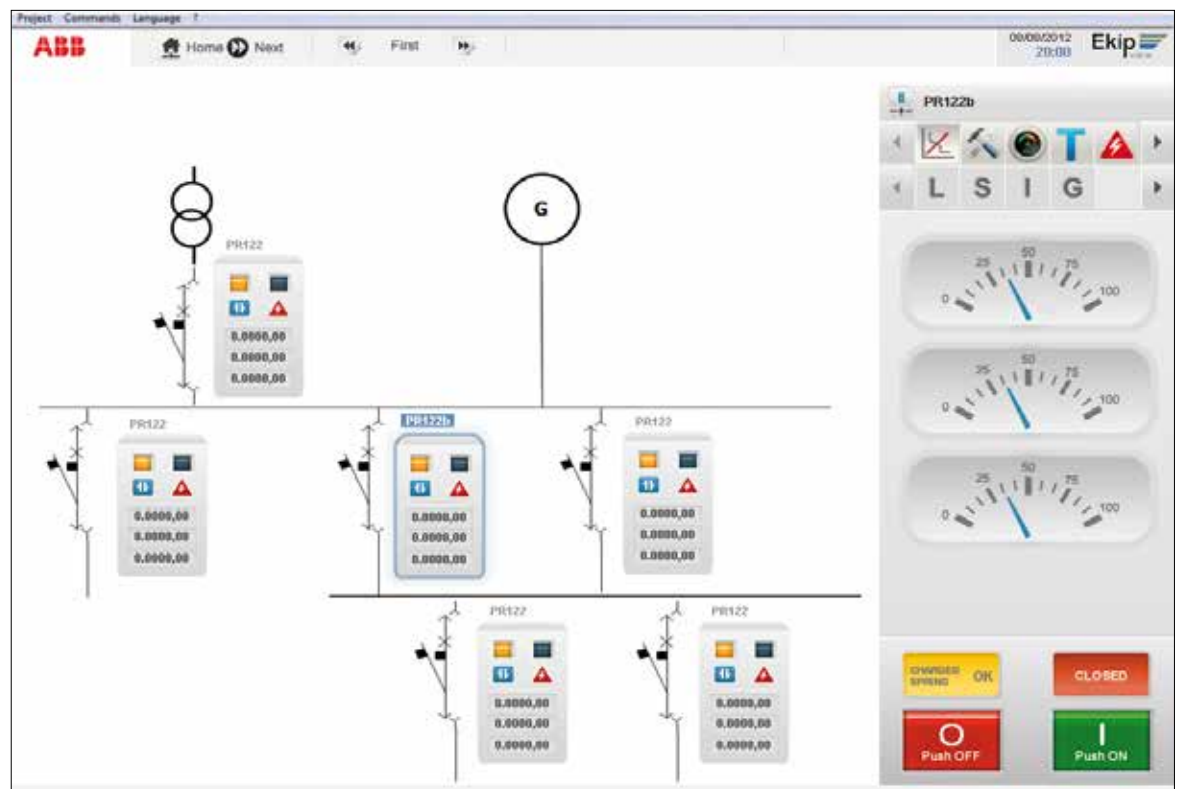

Ekip View is the ideal tool for all the applications that require:

- remote control of the system,
- monitoring of power consumption,
- fault detection of the system,
- allocation of energy consumption to the different processes and departments,
- preventative maintenance planning.

The main characteristics of Ekip View are:

- **Free and ready to use** engineering software to guide the user in the recognition and configuration of the protection units without the need for any system engineering supervision.

- **Dynamic mimic panel:** after automatic scanning of the network, for each of the devices found, Ekip View proposes a dynamic symbol that summarizes the most important information (status, electrical measurements, alarms). The extensive library of electrical symbols enables the entire electrical system to be represented in detail.
- **Analysis of trends:** the instantaneous and past trends of currents, powers and power factors are represented graphically and can be exported into Microsoft Excel for detailed analysis.
- **Reports:** advanced reports can be created regarding system and communication network diagnostics. Using the Alarm Dispatcher option, the user can receive the most important notifications via text message.
- **Web access:** to the installation, thanks to Ekip View's Web Server function.

6) According to the values supported by the trip units

Software and web application

ABB Ability™ Energy and Asset Manager is the state-of-the-art cloud-solution for monitoring, supervising and analyzing site equipment as well as the site's electrical distribution system, resulting in improved overall performance, efficiency and safety.

Through its scalable and flexible approach, ABB Ability™ Energy and Asset Manager ensures full-range integration of main electrical LV and MV equipment installed in the distribution and sub-distribution switchboards. It also enables upgrades at any time via the ABB Ability Marketplace™ in just a click. With a single easy-to-use interface, ABB Ability™ Energy and Asset Manager assists the user by means of a cloud computing or hybrid platform, enabling analysis of relevant data and optimization of installation anytime, anywhere.

Value proposition

- **Flexible and scalable platform**
 - Ease of use: the power of understanding at your fingertips
 - Remote visibility: discovery of facility performance anytime, anywhere
 - Faster payback
 - Scalable, from monitoring of a production line to the supervision of multiple sites.
- **Improved site efficiency**
 - Reduce cabling, connectivity components and commissioning time with embedded WiFi and 3G/4G
 - Save up to 20% on energy bills
 - Remove energy inefficiency by up to 10%
 - Identify unexpected consumptions and eliminate unwanted energy usage
 - 100% avoidance of penalties for low power factor.
- **Maximized performance**
 - 100% elimination of costly unplanned labor
 - Up to 40% maintenance-cost reduction: avoid unnecessary inspection and maintenance
 - Up to 15% extended asset lifetime
 - Up to 30% reduction in operational costs
 - Minimized risk of unplanned downtime
 - Monitoring up to 70% of potential asset-failure causes.
- **Enhanced personnel safety**
 - Improve safety: healthy assets mean healthy people mean healthy business
 - Keep operators safe with remote monitoring
 - Supervise and schedule maintenance remotely.

An external solution with ABB Ability™ Edge Industrial gateway

The Ekip ABB Ability™ Edge Industrial gateway module can be mounted on a DIN-rail to collect data throughout the system.

Moreover, it is possible to connect sensors for environmental parameters (temperature, water, gas) via both analog and digital I/O.

Modules for Wi-Fi or GPRS connection are provided as optional features.

For any further information please visit our website : <https://new.abb.com/about/our-businesses/electrification/abb-ability/energy-and-asset-manager>.

Accessories for Ekip Touch/Hi-Touch trip units

Connectivity

Tmax XT circuit-breakers can be integrated perfectly into all automation and energy management systems to improve productivity and energy consumption and to carry out remote service.

They can be equipped with communication units available for use with Modbus, Profibus, and DeviceNet™ protocols as well as with the modern Modbus TCP, Profinet and EtherNet/IP™ protocols. Furthermore, the integrated IEC 61850 communication module enables connection to automation systems widely used in medium voltage power distribution to create intelligent networks (Smart Grids). The modules are available in both solutions, internally and externally mounted. The internal modules are installed directly inside the circuit-breaker and the external modules can be easily installed directly on the terminal box or in the Ekip cartridge, even at a later date. Accurate measurements of current, voltage, power and energy are all available by means of the communication modules. The trip units themselves can be used as multimeters that display the measurements available, or the Ekip Multimeter can be connected on the front of the switch-gear without the need for external instruments. All the functions are also accessible via the Internet, in complete safety. In addition, a full set of information on the plant and circuit-breaker can be made available throughout the cloud via ABB Ability™ Energy and Asset Manager.

Circuit-breaker	Trip Unit Type	Internal modules	External modules with Ekip Cartridge

Internal modules

Available with several different communication protocols, the Ekip Com internal module is installed directly inside the circuit-breaker. It allows the circuit-breaker to be integrated in a communication network for supervision and control. Ekip Com internal modules can be used for the XT2-XT4 and XT5. They can be connected to the trip unit when Ekip Touch is used. In other cases (for the Ekip Dip, thermal-magnetic trip unit, or switch-disconnector), the Modbus RTU and TCP, available in the STA version (Stand-Alone), can be still installed inside the circuit-breaker to provide information on the status of the circuit-breaker and remote control (adding the motor operator).

XT2-XT4 Slim Ekip
Com RS-485

Slim Ekip Com RS-485 for XT2-XT4

Thanks to the reshape of its size, the internal communication module with the RS-485 protocol (available for XT2-XT4 equipped with Touch/Hi-Touch trip units) allows to install the additional auxiliary contacts 1Q and 1SY.

The Slim Ekip Com RS-485 for fixed/plug-in versions is supplied by default with the internal bus cable (CAN) available through the module, and with the 24V/IntBus side connection to be connected with the trip unit. For the withdrawable part, it is mandatory to have the side plug for the supply of the trip unit.

—
Slim Micro I/O for
XT2-XT4

Slim Micro I/O for XT2-XT4

The internal module is supplied by default within the Ekip Touch/Hi-Touch trip unit, if no other internal communication module has been selected, and it is mandatory for the correct functioning of the trip unit.

The new slim version allows to install additional auxiliary contacts, 1Q and 1SY, and to provide the 24V supply for the trip unit and the internal bus cable (in addition to the connection with the trip unit).

The module is available in two versions, one for fixed/plug-in circuit-breakers and one for withdrawable circuit-breakers, and allows to connect Ekip Cartridge or Ekip Multimeter directly with no need of any other connection from the side part of the trip unit.

—
Micro I/O for XT5

Micro I/O for XT5

The internal module is supplied by default within the Ekip Touch/Hi-Touch trip units, if no other internal communication module has been selected, and it is mandatory for the correct functioning of the trip unit.

It is available in one single version, fixed/plug-in and withdrawable, and it is always supplied with the connection with the trip unit.

Accessories for Ekip Touch/Hi-Touch trip units

Communication module

External modules

These Ekip Com modules, as well as the internal modules, allow integration in any communication network. They can be used on the XT2, XT4 and XT5 with an Ekip Touch/Hi-Touch trip unit by using the Ekip Cartridge. On the XT7 and XT7 M with an Ekip Touch/Hi-Touch trip unit, they can be mounted directly on the terminal box. Several modules can be used simultaneously enabling systems with different protocols, but also, in case of high reliability requirements, Ekip Com R modules can be installed to guarantee system redundancy. The Modbus RTU, Profibus-DP and DeviceNet™ modules contain a terminating resistor and two dip switches for optional activation to terminate the serial network or bus. The Profibus-DP module also contains a polarization resistor and two dip switches for its activation. When used on the XT7 and XT7 M, communication can be maintained with withdrawable circuit-breakers, even while they remain in the racked-out position, by using Ekip AUP auxiliary position contacts and Ekip RTC ready to close circuit-breaker contacts.

Protocols	Ekip Com Module	Ekip Touch/Hi-Touch
Modbus RTU	Ekip Com Modbus RS-485	■
Modbus TCP	Ekip Com Modbus TCP	■
Profibus-DP	Ekip Com Profibus	■
Profinet	Ekip Com Profinet	■
Ethernet / IP	Ekip Com Ethernet	■
DeviceNet	Ekip Com DeviceNet	■
IEC 61850	Ekip Com IEC 61850	■

Ekip Cartridge

The external device connected directly to the Ekip Touch trip unit of XT2, XT4 and XT5 allows most of the connectivity modules to be used including: the Ekip Supply, Ekip Com, Ekip Link, Ekip 3T, Ekip Signaling 2K and Ekip Synchro check. It is always necessary to install the Ekip Supply module. The Ekip Cartridge is available in two different versions: with 2 slots (1 Ekip Supply + 1 module) or with 4 slots (1 Ekip Supply + 3 modules).

If needed, when circuit-breakers in the withdrawable version are used, it is possible to connect the position AUP contacts to the related pins of the cartridge to avoid failure messages on the communication channel. The cartridge can be installed on a DIN-rail everywhere in the panel. The cable that connects the trip unit with the Ekip Cartridge is 1m long.

The external device can be also directly connected through the cable available with the new Slim Micro I/O avoiding the usage of a side connector with the trip unit.

Ekip Cartridge

Ekip Power Supply

Ekip Power Supply

The Ekip Supply module supplies all Ekip trip units and modules present on the Ekip Cartridge or terminal box of the circuit-breaker with several auxiliary power sources (in AC or DC) available in the switchgear. The module permits the installation of the other advanced modules. It can be field installed at any time. Two versions are available according to the control voltage:

- Ekip Supply 110-240V AC/DC
- Ekip Supply 24-48V DC

Ekip Link

Ekip Link

The Ekip Link module enables the Tmax XT circuit-breaker to be connected to an ABB communication system for locally supervising switchgear. It is available in both inside-breaker and external cartridge versions. It is available as:

- an inside-breaker version for XT2, XT4, and XT5 sizes
- a cartridge and terminal box mounted version for XT2, XT4, XT5, XT7 and XT7 M sizes.

Ekip Com Hub

Ekip Com Hub

The Ekip Com Hub is the new communication module for cloud-connectivity. A circuit-breaker equipped with Ekip Com Hub can establish a connection with an ABB Ability™ Energy and Asset Manager for the low-voltage power distribution panel.

This dedicated module is available in two versions: the inside-breaker (for XT2, XT4 and XT5 sizes) and the cartridge/ terminal box mounted versions (for XT2, XT4, XT5, XT7 and XT7 M sizes), even when other modules are present.

For further information related to the ABB Ability™ Energy and Asset Manager, please visit the dedicated website at <http://new.abb.com/low-voltage/launches/ekip-smartvision>.

In order to ensure cybersecurity of the device, the Ekip Com Hub has loaded a Certificate from a Trusted Authority. Ekip Com Hub has to be connected to the external network in order to refresh the Cybersecurity Certificate and have it always up to date. In case of long-term disconnections from the network, more than 6 months (e.g. module in stock or physically disconnected), the correct functioning of Ekip Com Hub can be inhibited from the cybersecurity measures in place. It is recommended to keep the module connected or periodically connect it (e.g. in stock or physically disconnected) to the external network.

Ekip Com Actuator

The Ekip Com Actuator module enables the XT7 M circuit-breakers to be opened and closed remotely. The Ekip com Actuator is optional and can be ordered for all Ekip Touch/Hi-Touch trip units equipped with Ekip Com or Ekip Link modules. The Ekip Com Actuator is installed on the front of the circuit-breaker in the right-hand accessories area.

Ekip Com Actuator

Accessories for Ekip Touch/Hi-Touch trip units

Signaling

Ekip 1K Signalling

The Ekip 1K Signalling module, available for the XT5, supplies one input contact and one output contact for control and remote signaling. It can be programmed from the trip unit display or through the Ekip Connect software and app. Furthermore, when using Ekip Connect, combinations of events can be freely configured. The Ekip 1K Signalling device is installed inside the circuit-breaker in the housing provided on the left down side of the circuit-breaker and it can be used when an Ekip Touch/Hi-Touch trip unit is present.

Ekip Signalling 1K

Ekip 2K Signalling modules

The Ekip 2K Signalling modules supply two input and two output contacts for control and remote signaling of alarms and circuit-breaker trips. They can be programmed from the trip unit display or via the Ekip Connect software and app. Furthermore, when using Ekip Connect, combinations of events can be freely configured. Three versions of the Ekip 2K Signalling modules are available: Ekip 2K-1, Ekip 2K-2, and RELT Ekip 2K-3. In this way, a maximum of three modules for XT2, XT4 and XT5 can be installed at the same time into an Ekip Cartridge, while a maximum of two modules can be installed at the same time into the terminal box for XT7 and XT7 M. Moreover, RELT Ekip Signalling 2K-3 module enables the wizard for easy configuration of the 2I protection.

Ekip 2K Signalling modules

Ekip 3T Signalling modules

The Ekip 3T Signalling modules provide three analog inputs for PT100/PT1000 thermo-resistances and one analog input 4-20mA for external sensors. Through the Ekip Connect commissioning tool, it is possible to set different control thresholds and associate them to digital signals. The Ekip 3T Signalling modules are suitable for all the versions of Ekip Touch and Hi-Touch trip units. However, PT100 sensors are compatible with the Ekip black platform only. Up to two modules can be installed simultaneously on SACE Emax 2: one Ekip Signalling 3T-1 and one Ekip Signalling 3T-2. ABB external probes PT1000 are available for busbar applications.

Ekip 3T Signalling modules

Ekip 10K Signalling unit

Ekip 10K Signalling unit

The Ekip 10K Signalling unit is an external device designed for DIN-rail installation. The unit provides ten contacts for electrical signaling of timing and tripping of protection devices. If connected via the Ekip Connect software, the contacts can be freely configured in association with any event and alarm or combination of both. Several Ekip 10K Signalling units (max 4) can be used at the same time on the same Ekip trip unit. The Ekip 10K Signalling module can be powered either by direct or alternating current and can be connected to all the trip units via internal bus or Ekip Link modules.

Ekip Signalling Modbus TCP

Ekip Signalling Modbus TCP

It is an external signalling unit designed for DIN rail installations. The function of the signalling module is to share - via an Ethernet network with Modbus TCP communication protocol - information about the state of circuit-breakers that might not have the ability to provide such information via Ethernet, and also to allow these circuit-breakers to be operated via remote control.

Output contacts characteristics		Number of contacts	
Type	Monostable	Ekip 1K	Ekip 2K
Maximum switching voltage	150V DC / 250V AC		
Maximum switching current			
30V DC	2A		
50V DC	0.8A	1 output + 1 input	2 output + 2 input
150V DC	0.2A		
250V AC	4A		
Contact/coil insulation	1000 Vrms (1min @50Hz)		

Ekip 10K/Ekip Signalling Modbus TCP power supply	
Auxiliary supply	24-48V DC, 110-240V AC/DC
Voltage range	21.5-53V DC, 105-265V AC/DC
Rated power	10VA/W
Inrush current	1A for 10ms

Signaling contacts for the XT7 and XT7 M Ekip trip units

With XT7 and XT7 M circuit-breakers, the Ekip trip units can acquire the status of the circuit-breaker ready to close (RTC) and racked-in, test, or racked-out position through the optional Ekip RTC and Ekip AUP signaling contacts. These contacts, housed in the accessories area of the circuit-breakers, are available with the Ekip Dip and Ekip Touch/Hi-Touch.

Signaling contacts for Ekip trip units

Accessories for Ekip Touch/Hi-Touch trip units

Protection

Ekip Synchrocheck

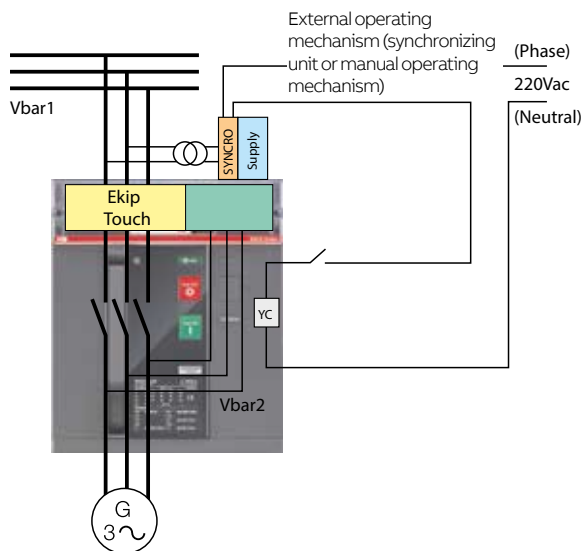

Ekip Synchrocheck

This module enables the control of the synchronism condition when placing two lines in parallel. The module can be used with the Ekip Touch/Hi-Touch trip units. Ekip Synchrocheck measures the voltages from two phases of one line through an external transformer and compares them to the voltage values measured at the circuit-breaker. An output contact is available, which is activated upon synchronism, and enables the circuit-breaker to be closed by means of wiring with the closing coil.

The Ekip Synchrocheck can be installed in the Ekip Cartridge (for XT2, XT4 and XT5) and in the terminal box (for XT7 and XT7 M).

Output contacts characteristics		Number of contacts
Type	Monostable	Ekip Synchrocheck
Maximum switching voltage	150V DC / 250V AC	
Maximum switching current		
30V DC	2A	1 output
50V DC	0.8A	
150V DC	0.2A	
250V AC	4A	
Contact/coil insulation	1000 Vrms (1min @50Hz)	

Ekip CI

Ekip CI

This module is an accessory for the Ekip M Touch LRIU trip unit and is needed when the circuit-breaker and the contactor must work in conjunction with each other. In this way the higher number of operations of the contactor are used instead of the circuit-breaker. When the trip unit is set in Normal mode (default mode) by means of the Ekip CI module the contactor is activated in one of the protection trips (excluding I and G protections); if the Heavy mode is set, the trip unit directly opens the circuit-breaker. The auto-reset function allows the actuation status of the Ekip CI to reset automatically after the contactor has tripped owing to the L function, once an adjustable time from 1 to 1000s has elapsed. Auto-reset can occur only in Normal mode. The BACK UP function is available and deals with situations whereby an opening command transmitted to the contactor via module Ekip CI has not been successful. In this case, the Ekip M Touch LRIU trip unit sends an opening command to the circuit-breaker after waiting a set time Tx. The actuation time of the contactor given by the manufacturer must be considered when the Tx time delay setting is entered. The function is active with an auxiliary supply.

Rating Plug

Rating Plug

The rating plugs are field interchangeable from the front on all the trip units and the protection thresholds can be adjusted according to the actual rated current of the system. This function is particularly advantageous in installations that may require future expansion or when the power supplied needs to be limited temporarily (e.g. mobile Gen Set). For the XT7 and XT7 M special rating plugs are also available for residual current protection against ground faults combined with a suitable external toroid. For the XT5, the following rating plugs are available for the two versions of Ekip Touch (400A and 600A). On the Ekip Touch 400 it is not possible to install the 500A and 600A rating plugs.

Nominal Value of the Rating Plug	Ekip Touch/Hi-Touch 400A	Ekip Touch/Hi-Touch 600A
250A	■	■
300A	■	■
400A	■	■

Accessories for Ekip Touch/Hi-Touch trip units

Cables and connectors

XT2-XT4 connectors for Ekip Touch/Hi-Touch trip units

The following items are available only for Ekip Touch/Hi-Touch trip units:

- Side connector 24V/IntBus for fixed/plug-in version
- Side connector 24V/IntBus, selectivity and external neutral for fixed/plug-in version
- Side plug to connect the trip unit to the 24V/internal bus, selectivity cable and external neutral cable for withdrawable version.

Side Connector

There are three possible side connections for Ekip Touch/Hi-Touch trip units: two versions for fixed/plug-in breakers and one version for withdrawable breakers.

1. Side connector 24V/IntBus F/P: 24V supply for the trip unit and internal bus cables, available with a unique connector to be mounted directly on the side of the trip unit and to be covered with a mandatory carter of 4 mm only. The connector is not supplied by default within the trip unit, because the same connections are already available through the slim Micro I/O.

In case of internal communication module, it is supplied by default within the module (only F/P version). The side connector is available as loose part.

2. Side connector 24V/IntBus/Ne/ZSI F/P: unique connector with 24V DC/internal bus cable, selectivity cable and external neutral cable, to be mounted directly on the side of the trip unit and to be covered with a mandatory carter of 4 mm only. The connector is not supplied by default within the trip unit.

In case of configured breakers factory mounted, if more than one of the functionality above has been selected, the side connector will be provided by default within the configuration, if there aren't any other possibilities to have the connection the trip unit.

The side connector is available also as loose.

3. Side plug 24V/IntBus/Ne/ZSI W: side plug connector with 24V DC/internal bus cable, selectivity cable and external neutral cable, to be mounted directly on the side of the trip unit.

The side plug is not supplied by default within the trip unit.

In case of configured breakers factory mounted, if more than one of the function above has been selected, the side connector will be provided by default within the configuration.

The side plug is available also as loose part.

XT5 connectors for Ekip Touch/Hi-Touch trip units

The following items are always provided with the Ekip Touch trip units for circuit-breakers in fixed/plug-in versions:

- a 24V DC supply/internal bus cable that supplies the trip unit, and connects the Ekip Cartridge and the Ekip Multimeter.

When a circuit-breaker with the withdrawable version of the trip unit is required, it is mandatory:

- a connection kit 24V/internal bus.

Zone Selectivity

To use the zone selectivity function for G and S protections, zone selectivity cables must be ordered.

For XT2-XT4 circuit-breakers, the zone selectivity cable is available into the fixed/plug-in version. For the withdrawable version, zone selectivity is only available through the side plug.

For XT5 circuit breakers, zone selectivity is available for two versions:

- fixed
- plug-in/withdrawable.

Current sensor for neutral conductor outside the circuit-breaker

External neutral sensors

Ekip Dip

The external neutral current sensor (to protect the neutral conductor) is available for 3-pole circuit-breakers equipped with Ekip Dip LIG, Ekip Dip LSI, and Ekip Dip LSIG electronic trip units.

Ekip Touch/Hi-Touch

With this trip unit it is possible to use both current and voltage sensors (to measure or protect the neutral conductor). The current sensor is available only for 3-pole circuit-breakers. For the XT7 and XT7 M the current sensor is connected through the terminal box; moreover the voltage connection can also be added to the terminal box area by just connecting a cable to the right connection point. To use the external neutral with XT2-XT4, the cable supplied by default within the sensor must be connected to the side part of the trip unit and the connection must be covered with the 4mm carter.

The current sensor available for XT2, XT4 and XT5 circuit-breakers is the version current + voltage, for measuring of both values.

It is always possible to select as loose part only the cables to be connected to the trip unit.

The sensors are available with the following rated currents:

Circuit-breaker	In	Ekip Dip			G-LS/I	Ekip Touch/Hi-Touch
		LIG	LSI	LSIG		
XT2	10	■	■	■	-	-
	25	■	■	■	-	-

Accessories for Ekip Touch/Hi-Touch trip units

Homopolar toroid for the earthing conductor of the main power supply

Homopolar toroid for the earthing conductor of the main power supply

The Ekip Touch/Hi-Touch trip units can be used with an external toroid positioned, for example, on the conductor that connects the star center of the MV/LV transformer to earth (homopolar transformer): in this case, the earth protection is called Source Ground Return. Four sizes of the toroid are available: 100A, 250A, 400A, 800A. The homopolar toroid is an alternative to the toroid for differential protection. This is for the XT7 and XT7 M only.

Toroid for differential protection

Connected to the Ekip Touch/Hi-Touch trip units equipped with a rating plug for differential protection, this toroid enables earth fault currents of 3...30A to be monitored. This is an alternative to the homopolar toroid and should be installed on the busbar system. This is for the XT7 and XT7 M only.

Toroid for differential protection

Display and supervision

Ekip Multimeter Display for the front of the switchgear

The Ekip Multimeter is a display unit which can be installed on the front of the switchgear for the Tmax XT circuit-breakers equipped with Ekip Touch/Hi-Touch trip units. The device is equipped with a large touch screen display and enables measurements to be displayed. If connected to trip units with a display, the Ekip Multimeter enables the adjustment of parameters and protection thresholds. Up to 4 Ekip Multimeter devices can be connected at the same time to the same Ekip protection trip unit to display currents, voltage, power and energy. The Ekip Multimeter can be connected to a single trip unit and can be powered either by direct current (24-48V DC or 110-240V DC) or alternating current (110-240V AC). It is equipped with a 24V DC output that supplies the trip unit to which it is connected (only if Ekip Supply is not used). Moreover, in case of XT2-XT4 sizes only, this device can be used also with the Dip version of Ekip LSI and Ekip LSI G trip units.

An Ekip Multimeter Display for the front of the switchgear.

Power supply	24-48V DC, 110-240V AC/DC
Tolerance	21.5-53V DC, 105-265V AC/DC
Rated Power	10VA/W
Inrush current	2A for 20ms

Lite Panel

The Lite Panel is a 7 inches local control panel that can monitor and control max 15 devices connected via Modbus TCP/IP or Modbus RTU. Available with Ekip Touch/Hi-Touch trip units.

The most important functionalities of this device:

- User administration: 5 level of user inside the Lite Panel
- Automatic scan via Modbus RTU and via Modbus TCP connection of various devices already mapped inside the Lite Panel: Emax 2, Tmax XT, ITS2, M4M, CMS700 etc...(see detailed list in the user installation manual)
- Local monitoring directly on the front of the panel for all devices
- Local control of devices: open, closing, reset

Alarm list and event log directly displayed from one access point

Lite panel

Accessories for electronic trip units

Ekip TT testing and power supply unit

Testing and programming

Ekip TT testing and power supply unit

This unit is compatible with the Ekip Dip and Ekip Touch/Hi-Touch trip units and allows a trip unit to be supplied so that the last protection device tripped can be viewed directly on the display or identified as the corresponding LEDs light up. The Ekip TT is a device that verifies that the circuit-breaker trip mechanism is functioning correctly (trip test). This device can be connected to the front test connector of any Ekip trip unit.

Ekip T&P testing kit

Ekip T&P testing kit

The Ekip T&P is a kit that includes different components for programming and testing the electronic protection trip units.

The kit includes:

- The Ekip T&P unit;
- The Ekip TT unit;
- Adaptors for the Emax and Tmax trip units;
- A USB cable to connect the T&P unit to the Ekip trip units;
- An installation CD for the Ekip Connect and Ekip T&P interface software.

The Ekip T&P unit is easily connected from your PC (via USB) to the trip unit (via mini USB) with the cable provided. The Ekip T&P unit can perform simple manual or automatic tests of the trip unit functions. Additionally, the Ekip T&P provides the possibility to perform more advanced function testing that allows simulations of very critical applications: real conditions of a system can be accurately represented by considering additional harmonics and shifting of phases. It also generates a test report as well as monitor maintenance schedules.

Ekip Programming module

Ekip Programming module

The Ekip Programming module is used for programming Ekip trip units via PC using the Ekip Connect software that can be downloaded online. The Ekip Programming module, which is connected to the PC via USB, can be useful for uploading/downloading entire sets of parameters for more circuit-breakers both for set-up and maintenance.

Accessories for XT2-XT4 Ekip trip units

Compatible with Ekip LSI and Ekip LSIIG trip units for the XT2 and XT4 sizes

Ekip Display

Ekip Display

The Ekip Display is a unit that can be applied on the front of the solid-state trip unit and shows the current values, alarms, and protection settings.

Main features:

- **Installation:** The Ekip Display can be easily installed on the front of the Ekip LSI and Ekip LSIIG electronic trip units. It is connected by means of the test connector on the front of the trip unit, and fixing is simple and reliable thanks to a specially designed mechanism. This mechanism also provides a practical way of fastening the accessories to the circuit-breaker to prevent undesired access to the dip-switches. Installation can be carried out under any condition, even with the door closed and the electronic trip unit already on and functioning.
- **Functions:** The Ekip Display has four buttons for browsing through the menus. It functions in self-supply mode starting from a current of $I > 0.2 \times I_n$ circulating through at least one phase. Backlighting is activated in the presence of higher loads, thereby allowing better legibility of the visualized information. Rear lighting comes on in self-supply for a current of $I > 0.4 \times I_n$ and is always on when there is an electronic trip unit auxiliary power supply.

The Ekip Display:

- shows the current, voltage, power and energy values;
 - shows the settings of the protection functions in Amperes or in I_n ;
 - shows the protection that has caused the trip unit to trip and the fault current (only when there is 24V external voltage or the Ekip TT unit);
 - allows the trip thresholds of the trip unit to be programmed and the communication parameters to be set on the bus system.
- **Compatibility:** The Ekip Display can be fitted even when the front accessories, such as the motor or direct and transmitted rotary handles etc. are already installed. It is possible to use Ekip TT or Ekip T&P without removing the Ekip Display.

Ekip LED Meter

Ekip LED Meter

The Ekip LED Meter can be applied to the front of the electronic trip unit and displays the current values and alarms.

Main features:

- **Installation:** The Ekip LED Meter can be easily installed on the front of Ekip LSI and Ekip LSIIG electronic trip units. It is connected by means of the test connector on the front of the trip unit and fixing is simple and reliable thanks to a specially designed mechanism. This mechanism also provides a practical way of fastening the accessories to the circuit-breaker to prevent undesired access to the dip-switches. The installation can be carried out under any condition, even with the door closed and the electronic trip unit already on and functioning;
- **Functions:** The Ekip LED Meter provides an accurate indication of the value of the current circulating in the trip unit by means of a scale of LED. Their different colors allow normal operation, pre-alarm and alarm states of the circuit-breaker to be recognized at a glance. It is active in self-supply mode from a current of $I > 0.2 \times I_n$ circulating through at least one phase or when the auxiliary power is available for the electronic trip unit;
- **Compatibility:** The Ekip LED Meter can also be fitted when front accessories, such as the motor, direct and transmitted rotary handles etc. are already installed. It is possible to use the Ekip TT or Ekip T&P without removing the Ekip LED Meter. It is not possible to use the Ekip LED Meter with a withdrawable breaker version.

Accessories for XT2-XT4 Ekip trip units

Ekip Com

Ekip Com

The Ekip Com allows the MOE-E motor operator to be controlled, to determine the ON/OFF/TRIP state of the circuit-breaker and to connect an electronic trip unit to a Modbus communication line. The Ekip Com is available in two versions: one version for the circuit-breakers in the fixed/plug-in version and a version complete with a connector for the fixed moving parts for circuit-breakers in the withdrawable version.

Main characteristics:

- **Installation:** The Ekip Com module is inserted in the right-hand slot of the circuit-breaker and fixing is carried out without any need for screws or tools. Connection to the trip unit is done by using a special small cable which is fitted with a cable guide. The connection towards the Modbus line is made by means of the terminal box to which a 24V DC auxiliary power supply must also be connected, which activates both the module and the protection trip unit. The Ekip Com is supplied always together with the Ekip Display.
- **Functions:** The Ekip Com module can acquire the state of the circuit-breaker remotely and, in combination with the MOE-E motor operator, allows the circuit-breaker to be opened and closed. If combined with a trip unit fitted with a communication function (Ekip LSI or Ekip LSIG), the Ekip Com module allows the trip unit to be connected to a Modbus network, offering the possibility of programming the protections and acquiring the measurements and alarms when it is connected to a control and/or supervision system. When it is connected to the HMI030 unit, it is possible to have this data locally on the front of the switchboard.

Accessories for XT2-XT4 Ekip trip units

HMI030 interface on the front of the switchboard

HMI030 interface on the front of the switchboard

The HMI030 is an interface on the front of the switchboard which is only usable with protection trip units fitted with the Ekip Com.

Main features:

- **Installation:** The HMI030 can be fitted into the hole in the door using an automatic click-in method. In situations where mechanical stress is particularly intense, it can also be installed by using the special clips supplied. It must be connected directly to the Ekip LSI and Ekip LSIG protection trip units with Ekip Com via the serial communication line. The HMI030 requires a 24V DC power supply.
- **Functions:** The HMI030 consists of a graphic display and four buttons for browsing through the menus. This accessory allows you to view:
 - the measurements taken by the trip unit to which it is connected;
 - the alarms/events of the trip unit.Thanks to its high level of accuracy, the device is a valid substitute for conventional instruments without any additional current transformer.
- **Communication:** The HMI030 is provided with two communication lines, to be used alternatively with:
 - Modbus
 - Local BusConnecting the Ekip LSI and Ekip LSIG to the Local Bus allows the Modbus line of the Ekip Com module to connect to a different communication network.

Energy Measurements

5/2 **Introduction**

5/4 **Class 1 accuracy**

Network Analyzer

5/5 Applications

5/7 The first step towards better power
quality: measurement

5/8 Operating principles

Introduction

The Tmax XT circuit-breakers have been designed to manage all low voltage electrical installations with maximum efficiency: from industrial plants, naval applications, traditional and renewable power generation installations to buildings, shopping centers, data centers and communication networks.

Achieving maximum efficiency of an electrical installation in order to reduce consumption and waste requires intelligent management of power supplies and energy. For this reason, the new technologies used in the Tmax XT circuit-breakers with

Ekip Touch trip units allow the productivity and reliability of any installation to be optimized, and at the same time, power consumption to be reduced while fully respecting the environment.

**Class 1 in power and energy measurements**

Before starting to take any action on electrical systems and to analyze the available data, top accuracy on measurements must be guaranteed.

Thanks to the Ekip Touch trip units, the SACE Tmax XT range of circuit-breakers guarantees extremely accurate measures, in compliance with the relevant IEC 61557-2 Standard.

Network Analyzer

The quality of the power supply is an important factor to consider in order to preserve the loads, to avoid equipment malfunctions, and to optimize energy consumption. The power quality of a power system is never a perfect sinusoidal waveform, distortions and harmonics are always present. Several parameters that cause reductions in power quality can be monitored and controlled thanks to the Network Analyzer embedded function. In this way, the use of expensive external devices can be avoided.

Class 1 accuracy

With the Ekip Touch/Hi-Touch trip units the embedded measurement functionalities allow the measurement of power and energy to a Class 1 degree of accuracy, as specified by the IEC 61557-12 Standard, avoiding the need of additional device, saving costs, space and installation time.

With the Ekip Touch/Hi-Touch trip units, measurements of power and energy to a IEC 61557-12 Standard compliant, Class 1 level of accuracy, are guaranteed by the embedded measurement functionalities. Thus, there is no need for additional devices, with consequent advantages in terms of cost savings, space reduction and installation time optimization.

When energy needs monitoring, even a minimal percentage of errors would result in a waste of money. Accuracy is everything and depends on the design and manufacturing quality of solution used. The Tmax XT with Ekip Touch trip units guarantee 1% accuracy for power and energy monitoring.

Thanks to the extremely accurate Rogowsky coil, ABB Ekip Touch/Hi-Touch trip units are able to guarantee Class 0.5 for voltage and current measurements and Class 1 for active power and energy measurements, complying with and certified by the IEC 61557-12 Standard (see Chapter 3 for more detailed information about the accuracy and the monitored parameters of the electrical system). IEC 61557-12 can be applied to both AC and DC electrical networks up to 1000 V AC or 1500V DC.

Moreover, an upgrade of the device is always guaranteed to be quick and easy: the measurement functions not included in an installed trip unit can be downloaded directly from the ABB Ability Marketplace™ via Ekip Connect Mobile, thus allowing new system requirements to be met with ease. Measurement data can be displayed in several ways:

- On the embedded display on the trip unit
- On a smartphone via Bluetooth (Ekip Connect Mobile App)
- Using the Ekip Connect software on a PC
- On an Ekip Multimeter external display
- On a cloud-platform thanks to ABB Ability™ Energy and Asset Manager
- In the supervision system (ex SCADA) thanks to several communication protocols
- On the control panel display

Network Analyzer

Thanks to the Network Analyzer function available in all Ekip Touch/Hi-Touch trip units, the quality of energy based on harmonics, micro-interruptions or voltage dips is monitored without the need for dedicated instrumentation.

Thanks to Ekip Touch/Hi-Touch Network Analyzer, effective preventive and corrective actions can be implemented through accurate analysis of faults, thereby improving the efficiency of the system.

Applications

Electrical equipment is designed for optimum operation under constant and uniform voltage level, as close as possible to the rated value. In addition, industrial equipment, working on a three phase supply, requires the three phase voltage levels to be balanced. Power quality is a description of how well a power system complies with the above ideal conditions. Power quality issues can have negative consequences on the components and on the energy efficiency of the network. Thus, power quality monitoring is becoming more important in modern power systems, and will be a key part of the smart grid of the future.

In particular, power quality evaluation includes the following aspects:

- Deviations of voltage average value from the rated value
- Short decreases (sags) or increases (swells) of voltage value
- Voltage unbalance, i.e. difference in voltage values between different phases
- The presence of current and voltage harmonics.

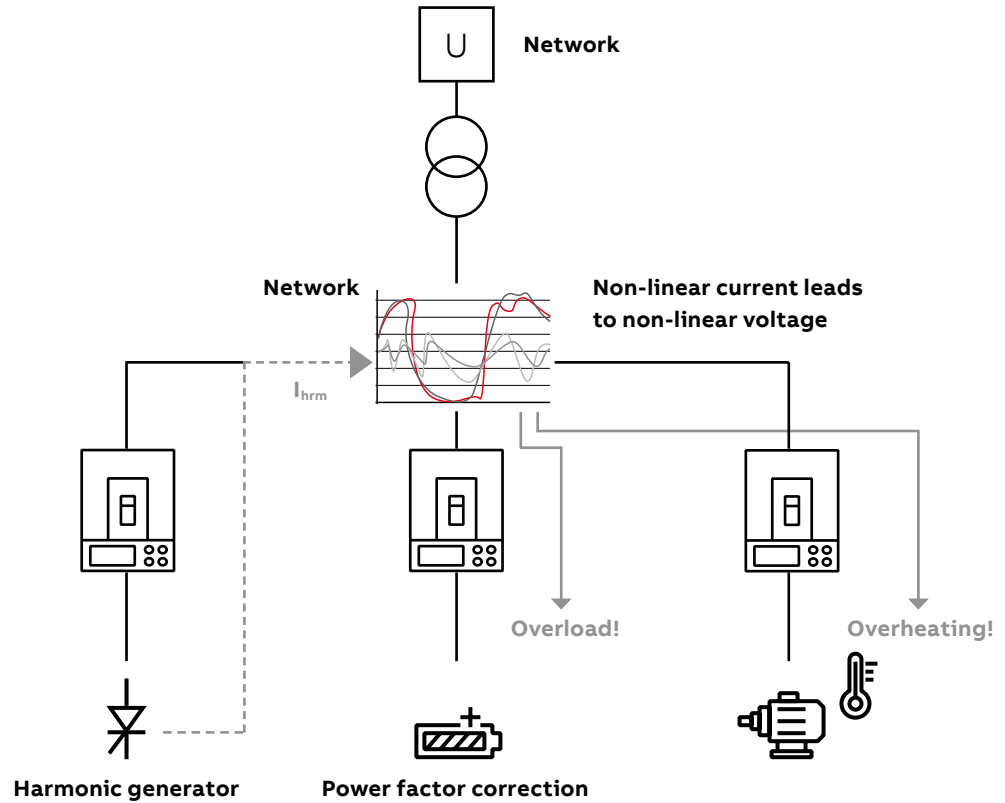

Distortions of the voltage value (sags, swells) and/or frequency can have fatal consequences, especially for process industries, leading to possible production stoppages with consequently expensive downtime, damage to motor drives and damage to PLCs. Examples of process industries that can be badly hit by voltage instabilities include the plastics, petrochemicals, textiles, paper, semiconductor, and glass industries.

Voltage sag is defined as when the value of the voltage is reduced below the rated one for a certain amount of time. Similarly, voltage swell is defined as when the voltage is increased above the rated value for a certain amount of time.

RMS voltage values and frequency are two fundamental features of a voltage signal, but the “purity” of the voltage waveform is also an important point. An ideal voltage waveform should be a perfect sinusoid, but this is not something that is normally seen in the real world. Frequencies other than the fundamental are always present.

These frequencies are called harmonics: a harmonic of a signal is a component frequency of the wave spectrum that is a multiple of the fundamental frequency. Harmonic content is an issue that is becoming increasingly debated: technological developments in the industrial and household field have led to the spread of electronic equipment which, due to their operating principles, absorb a non-sinusoidal current (non-linear load). Such current causes a non-sinusoidal voltage drop on the supply side of the network with the consequence that the linear loads are also supplied with a distorted voltage.

Network Analyzer

Power electronics produce harmonic content that can affect other loads in the plant: the result can be an overheating of the asynchronous motor and an overload (that could lead to a trip of the protecting MCCB) on the power factor correction capacitors.

To get information about the harmonic content of voltage and current waveforms and to take measures if such values are high, a dedicated index has been defined. The total harmonic distortion (THD) of a signal is a measurement of the harmonic distortion present.

The first step towards better Power Quality: measurement

A Power Quality monitor is the most commonly used tool for detecting voltage sags and power quality issues. Measurement is the first step for checking the status of the installation and starting the root cause analysis. Power Quality measurements and related instrumentation are described in specific industrial Standards such as IEC61000-4-30 and IEEE 1250. For the first time, thanks to the Ekip Touch trip units for the Tmax XT, the power quality monitor is embedded in a low voltage molded case circuit-breaker. The Network Analyzer function complies with the prescriptions of IEC 61000-4-30 and IEEE 1250.

The Network Analyzer function allows the user to set controls on the voltage in order to analyze the operation of the system: any time a control parameter exceeds a preset threshold, an alarm is generated. The accuracy of voltage measurements by the Tmax XT is excellent at 0.5%. The Tmax XT Network Analyzer complies with IEEE 1250-2011, Section 3 for the monitoring of the voltage value, unbalance and harmonic content, which is the equivalent of IEC61000-4-30 Class S for voltage values and unbalance and Class B for the harmonic content.

Network Analyzer

Hourly average voltage value

Short voltage interruption

Short voltage spikes

Slow voltage sags and swells

Voltage unbalance

Harmonic analysis

Referring to the voltage sag ambit, as an example, the Network Analyzer function has the ability to control three kinds of sag classes, defined by the user:

Parameter	Description
Sag Threshold (First Class)	This defines the first alarm threshold. It is expressed as % Un.
Sag Times (First Class)	In the event of dropping under the first alarm threshold, this defines the time beyond which the alarm counter is increased.
Sag Threshold (Second Class)	This defines the second alarm threshold. It is expressed as % Un.
Sag Times (Second Class)	In the event of dropping under the second alarm threshold, this defines the time beyond which the alarm counter is increased.
Sag Threshold (Third Class)	This defines the third alarm threshold. It is expressed as % Un.
Sag Times (Third Class)	In the event of dropping under the third alarm threshold, this defines the time beyond which the alarm counter is increased.

Two different types of counters for each power quality monitoring function are made available directly on the trip unit touch screen: one is a cumulative counter, which stores all the alarms (for example, all the voltage sags) from the beginning, and one is a 24h counter, that shows the alarms in the last 24 hours.

With the optional communication module (Modbus, Profibus, Profinet, etc.) eight counters for each power quality monitoring function are available: one is the cumulative and the other seven are the daily counters of the last seven days of activity.

Network Analyzer

Operating Principle

The Network Analyzer function performs continuous monitoring of the quality of energy, and shows all results through a display or communication module. In particular:

- **Hourly average voltage value:** in accordance with international Standards, this must remain within 10% of the rated value, but different limits can be defined according to the needs of the installation. The positive sequence voltage is compared with the limits. If the limits are exceeded, the Ekip Hi-Touch generates a signaling event. The number of these events is stored in a suitable counter. The counter values are available for each of the last 7 days, as well as the total. The measures available are the positive and negative sequence voltages and positive and negative sequence currents of the last interval monitored. The time of the calculation of the average values can be set between 5 minutes and 2 hours.
- **Interruptions / short dips in voltage:** if the voltage remains below a threshold for more than 40ms, the Ekip Hi-Touch generates an event that is counted in a dedicated log. The voltage is monitored on all lines.
- **Short voltage spikes** (voltage transients, spikes): if the voltage exceeds a threshold for 40ms, set for a pre-determined time, the Ekip Hi-Touch generates an event that is counted.
- **Slow voltage sags and swells:** when the voltage strays outside a range of acceptable limit values for a time greater than the one set, the Ekip Hi-Touch generates an event that is counted. Three values can be configured for voltage sags and two for voltage swells, each associated with a time limit: this enables verification of whether the voltage remains within a curve of values that are acceptable by equipment such as computers. The voltage is monitored on all lines.

- **Voltage unbalances:** if the voltage values are not equal or the phase displacements between them are not exactly 120°, an unbalance occurs, which is manifested with a negative sequence voltage value. If this limit exceeds the threshold value set, an event is stored which is counted.
- **Harmonic analysis:** the harmonic content of voltages and currents, measured to the 50th harmonic, as well as the value of the total harmonic distortion (THD), are available in real time on the display or through the communication modules. The Ekip Hi-Touch also generates an alarm if the THD value or a magnitude of at least one of the harmonics exceeds the values set. The voltage and current values are monitored on all phases.

All information can be displayed directly on the screen (for the XT5, XT7, XT7 M) or on a smartphone, a PC or in a network system with any of the communication modules. This is an embedded function of Ekip Touch/Hi-Touch trip units and analyzes important parameters of the distribution network including:

- The average voltage value
- Short voltage interruptions and spikes
- Slow voltage sags and swells
- Voltage unbalance
- Harmonic analysis

Introduction

The use of renewables has been growing over the last 10 years reducing the polluting emission for a greener world. Due to environmental changes, people have started to think about ecology and sustainability, increasing their awareness of energy self-consumption and increasingly concerned about energy efficiency.

The Tmax XT is the first smart moulded case circuit-breaker enabling all-in-one solutions that combine advanced protection, programmable logics, full connectivity, easy integration and comprehensive energy management in a single revolutionary device or at the local generation side.

Installed downstream the MV/LV transformer, Tmax XT and its adaptive protections recognize the network changes and automatically set new thresholds to guarantee protection and coordination in on-grid and off-grid conditions.

The Tmax XT is able to integrate programmable logics for protection features and Automatic Transfer Switching (ATS) in one device. This unique integrated solution avoids the usage of other external control units, guaranteeing a minimal switchgear footprint and saving commissioning time. A strong reduction in the connection wiring simplifies the installation and commissioning phase. The load shedding embedded algorithm is able to manage the power system for comprehensive microgrid energy management. Before the transfer from the main grid to the local line, selected loads are shed to support power balance. Using a frequency slope, the Tmax XT disconnects loads only in cases of emergency unbalanced conditions.

In grid-connected operations, the Tmax XT manages the **Power Controller** algorithm to shave peaks and shift loads in order to optimize system performance and productivity.

The advanced features of the Tmax XT are easily customized thanks to commissioning software tools which do not require high level engineering competencies. Ready to use templates enable the download of all the logics directly in the trip unit. The solutions are plug & play, increasing modularization and standardization for design and installation. The advanced functionalities which have been developed and integrated in the Tmax XT are described in the following compatibility table.

	Load Shedding	Automatic Transfer Switch	Power Controller
Load Shedding		●	●
Automatic Transfer Switch	●	●	●
Power Controller	●	●	●

Power Controller

The Tmax XT is able to control loads and generators to ensure bill savings and enable demand response according to power management strategies.

Purpose

Thanks to the Power Controller software, Tmax XT manages the power to shave the peaks and shift the loads. In this way, it is possible to cut electricity bills, increase energy efficiency by up to 20% and be ready for demand response programs.

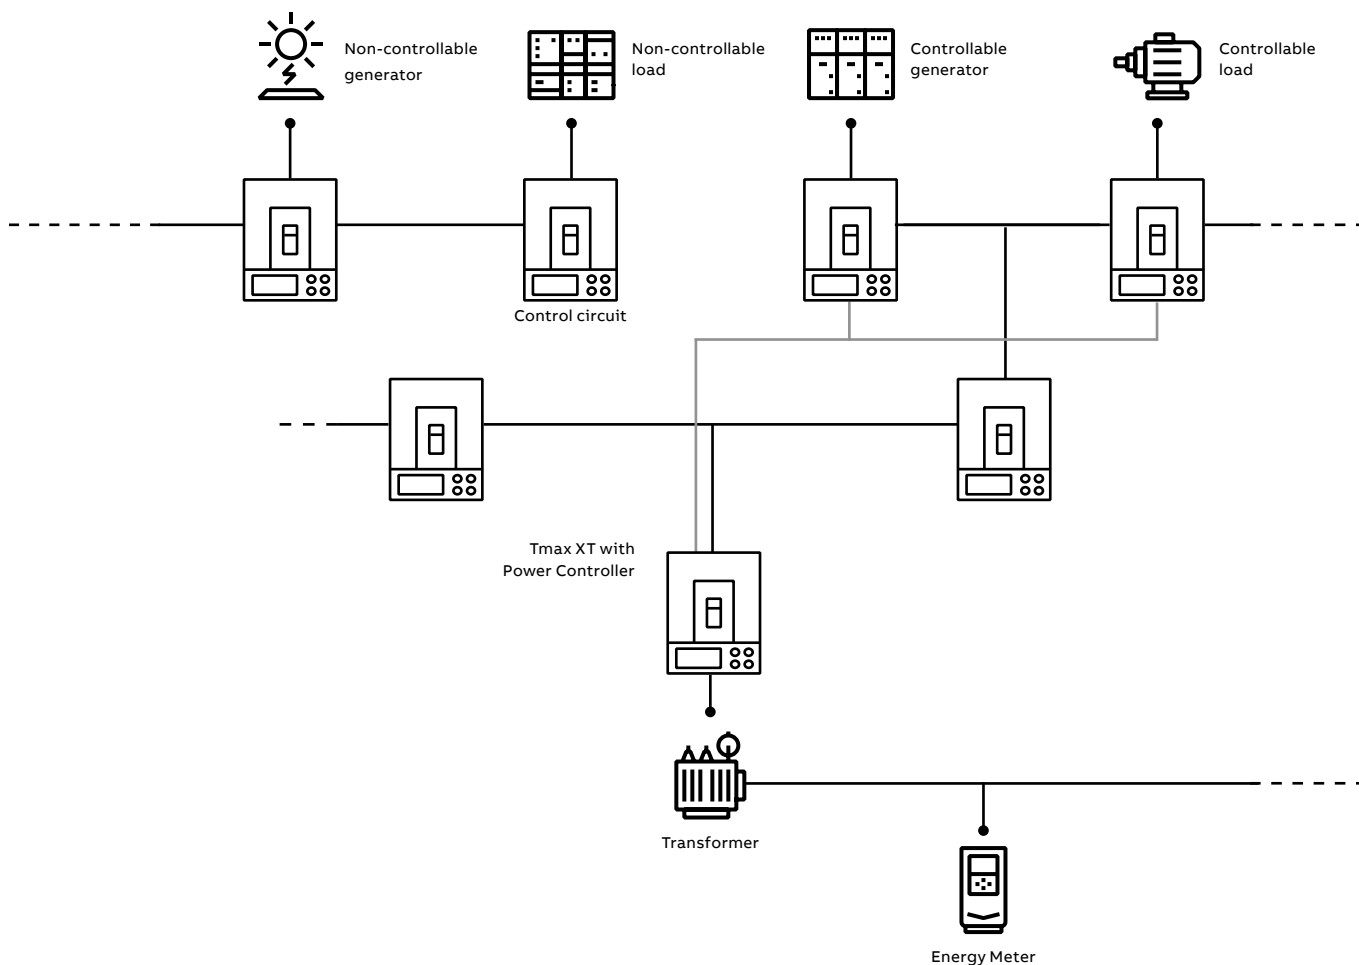

The Power Controller function is based on a patented calculation algorithm that allows a load list to be controlled via the remote command of relevant switching devices or control circuits according to a defined priority. The user (locally), or the load aggregator / utility (remotely) - define the load disconnection priority based on their own requirements and types of loads.

The algorithm is designed for the anticipated average power absorption which can be set by the user over a determined time interval.

Whenever this value exceeds the fixed power, the Power Controller function intervenes to bring it back within the limits.

This system can be realized with a single Tmax XT Control or Tmax XT Control+ Standard equipped with this function and installed as the low voltage plant controller.

Furthermore, the control unit, not only manages passive loads, but it can also manage a reserve generator.

The Ekip Power Controller can be used with all Ekip Touch/Hi-Touch trip units of the Tmax XT series and effectively helps to improve energy efficiency by managing the entire low-voltage electrical system. It is fully able to adapt the demand for power according to the availability of the energy source, the time of day and the costs indicated in the current pricing plan.

In this way, the Ekip Power Controller is able to maintain power consumption within the limits defined, thereby optimizing the costs of managing the installation and reducing emissions.

Commands sent to downstream devices can be performed in two different ways:

- through the wired solution, by commanding the shunt opening/closing releases or acting on the motor operators of the loads to be managed;
- through a dedicated communication system.

The ability to control the loads according to a list of priorities already defined provides significant advantages from both the economic as well as technical points of view:

- **Economic:** energy consumption optimization is focused on the control of the costs linked in particular to penalties that are levied when the contractual power is exceeded or when the contractual power is increased by the Distribution System Operator (DSO) as a consequence of exceeding the limit repeatedly.
- **Technical:** the solution provides the ability to absorb power over the contractual limits for shorter periods and also the management and the control of the power consumption over long periods of time. Thus, it is possible to reduce the likelihood of malfunctioning due to overloads, or worse, complete inefficiency of the entire plant due to tripping of the LV main switching device.

The exclusive Power Controller function available on the new Tmax XT circuit-breakers monitors the power, keeping it below the limits set by the user. As a result of this more effective use, the peak of power consumed can be limited allowing savings on electricity bills.

The Power Controller, patented by ABB, disconnects non-priority utilities, such as electric car charging stations, lighting or refrigeration units, during the times when consumption limits need to be respected, and connects them again as soon as it is appropriate. When required, it automatically activates auxiliary power supplies such as generator sets. No other supervision and control system is required: it is sufficient to set the required load limit on the Tmax XT, which can control any switching device located downstream, even if it is not equipped with a measurement function.

Application examples

Electricity bill savings, demand response, and avoiding power overloads are the typical scenarios where the Power Controller is used.

The Power Controller is commonly used in office buildings, shopping malls, hotels, campuses, waste and water industries or any plant that works like a low voltage microgrid.

Power Controller

Benefits

Thanks to the Tmax XT with the embedded Power Controller, the following benefits are guaranteed:

- **Reduction of energy costs with minimum impact**

The loads are disconnected from the power supply for short periods, in the minimum number necessary and in a fixed order of priority, enabling power consumption peaks to be limited. This allows the contract drawn up with the energy provider to be renegotiated, reducing the power allocated, with a consequent reduction in total energy costs.

- **Power limited only when necessary**

The Power Controller function manages up to four different time bands. It is therefore possible to respect a particular power limit according to whether it is during the day (peak) or night (off peak). In this way, consumption during the day when rates are at their highest can be limited.

- **Easy of use**

The Power Controller function allows the installation to be managed efficiently with a simple architecture. Thanks to a patented design, it is sufficient to measure the total power of the installation without having to measure the power consumed by each load. Installation costs and times are thereby reduced to a minimum.

The Power Controller function does not require the writing, implementation or testing of complicated programmes for PLC or computer because the logic has already been implemented in the protection unit and is ready to use. It is sufficient to set the installation parameters from a smartphone or directly from the switching device display.

Thanks to the integrated communication modules, the Power Controller can receive the maximum absorbable power directly from the medium voltage control system, determining consumption for the next 15 minutes. According to the information received, the Ekip Power Controller manages the switching off of non-priority loads or the switching on of reserve generators. The software gives maximum priority to non-programmable preferred energy sources, such as wind and solar, and they are therefore considered uninterruptable. In the event that the production of internal power to the controlled network is reduced, due, for example, to decreased production of solar power, the Power Controller will disconnect the necessary loads to respect the set consumption limit.

This benefit is used, for example, in installations with a system of cogeneration. Indeed, the Power Controller controls the total consumption drawn from the electrical network, disconnecting non-priority loads when generation is reduced and reconnecting them when generator power is sufficient not to exceed limits.

There are multiple advantages of the system including: reduction in energy costs, maximum use of local generation and greater overall energy efficiency.

Adaptive Protections

The Tmax XT adds a dual setting capability to the switching device to ensure continuous coordination

Purpose

User's plants can work as a LV microgrid thanks to the energy produced by renewable and local power sources, in particular as a consequence of the lack of an utility power supply, e.g. due to a fault on the MV voltage side. In order to still guarantee a high level of selectivity and continuity of service, it is important to take into account the variation of the short-circuit power when moving from on-grid to off-grid operation.

Indeed, during grid connected conditions the fault current on a microgrid feeder is also supplied by the utility, thus resulting higher than the one supplied only by local generation during islanded conditions. As a result, it is desirable that several protection thresholds of the units can be automatically changed during the transition to islanding conditions.

Application example

A plant is connected to the MV utility by means of a MV/LV transformer. If the utility shuts down, the plant will become a microgrid supplied by a local generator G, which will feed priority loads by using the load shedding feature of the Tmax XT.

In a grid-connected condition, the generator G is disconnected. With reference to Fig. 1:

- Circuit-breaker A is closed
- Circuit-breaker B is open
- Circuit-breakers at position C are closed. The protection of the circuit-breaker at C that supplies the feeders at D are adjusted using "Set A" of the Tmax XT unit.
- Circuit-breakers at position D are closed
- Circuit-breaker E is closed
- Molded case switch QS1 is closed
- All loads are supplied.

The circuit-breakers at position C are selectively coordinated with the upstream main circuit-breaker A, supplied by the utility, and the downstream load circuit-breakers at position D (see Fig. 2 at the following page).

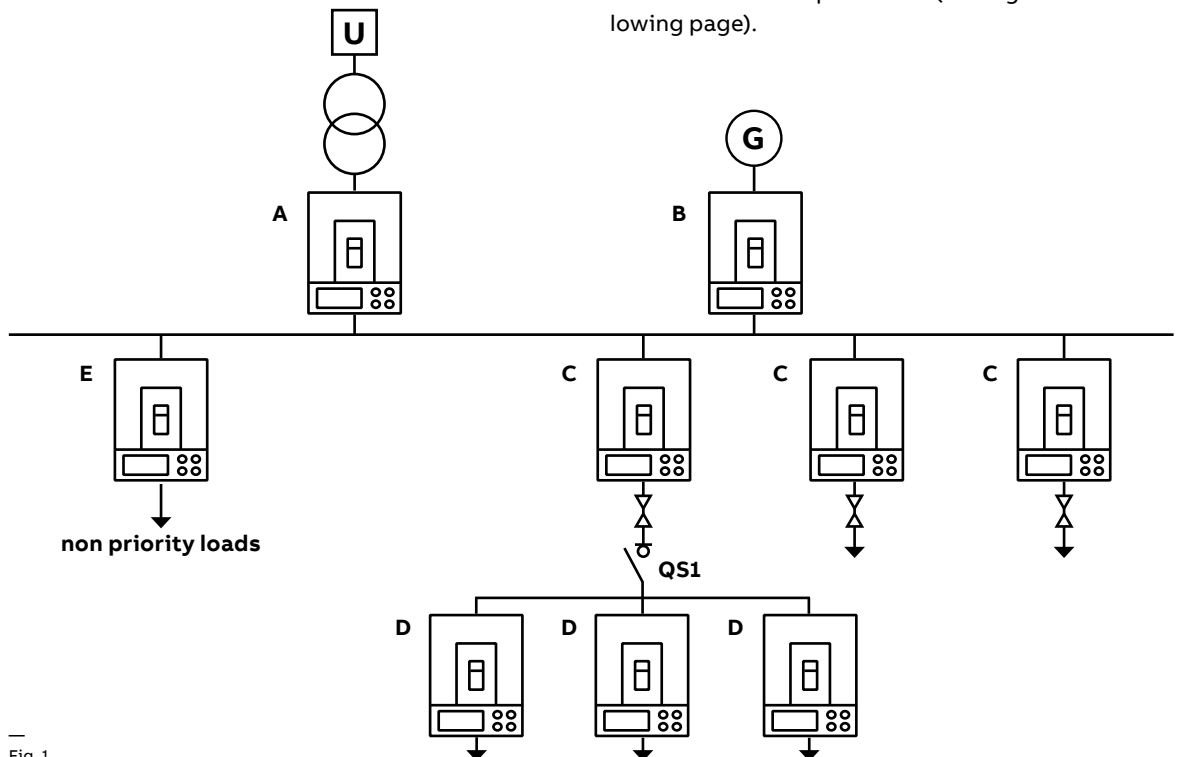

Fig. 1

Adaptive Protections

With the adaptive protections, when there is an utility outage, circuit-breaker A opens and B closes in order to achieve an islanded condition. In order to still guarantee selectivity, another set of protection settings is required. Adding Tmax XT adaptive protections to the circuit-breaker C1 ensures this behaviour. The second protection setting is optimized for the characteristics of the local generator ensuring the incoming supply. Additionally, selective coordination with the load side switching devices is also guaranteed.

With reference to Fig. 1:

- Circuit-breaker A is open
- Circuit-breaker B is closed
- Circuit-breakers at position C are closed and the protection thresholds move automatically to “Set B”
- Circuit-breakers at position D are closed
- Circuit-breaker E is open
- Molded case switch QS1 is closed
- Non-priority loads can be disconnected using another functionality of the Tmax XT units (see next paragraph).

Fig. 3 shows how it is possible to switch to a set of parameters which guarantees selective coordination between circuit-breakers C and B by means of the Adaptive Protection function embedded in the trip unit of the C circuit-breakers.

Fig. 2 - Protection thresholds during on-grid operation

Benefits

Thanks to the Tmax XT it is possible to have two sets of settings implemented in a single device. As a result, the following benefits are guaranteed:

- Overcurrent protection and selectivity 100% guaranteed both in grid-connected and islanded conditions.
- Service continuity is guaranteed by just adding a single unit to the switchboard in every plant condition.
- Ease of use, thanks to the Ekip Connect software which allows an immediate and intuitive commissioning phase.

Fig. 3 - Protection thresholds during islanded operation

Load Shedding

The Tmax XT has many load shedding algorithms to avoid power unbalance in low voltage plants and to reduce stress for all the components.

Purpose

The Tmax XT embeds patented functions based on load shedding which reduce the microgrid stress in all situations. Typically, it is the main protection trip unit of the low voltage microgrid located at the interface point with the medium voltage grid that is able to control the plant in all circumstances.

A microgrid under islanding conditions

After the Tmax XT circuit-breaker opens, due to the interface protection system intervention or external command, the microgrid should seamlessly pass from an on-grid to off-grid state. When it operates in a stand-alone capacity, the power absorption from the main grid ceases, so that the microgrid loads remain supplied by local generation, such as from a diesel GenSet or an energy storage system. This microgrid generation can be always active or started by Automatic Transfer Switching (ATS) logic after the disconnection from the main grid, depending on the plant configuration. During the islanding transition, it is very important to avoid a frequency drop, otherwise the generation protections could trip and jeopardize the microgrid stability with a consequently long downtime. The Tmax XT employs current and voltage measurements, and integrates two different fast load shedding types of logic to reduce this blackout risk. This protects the microgrid during intentional or unintentional islanding operations:

- The Basic Load Shedding algorithm is a simple form of logic able to recognize the microgrid disconnection event and shed a group of not priority loads thus ensuring a fast time response and power balance.
- The Adaptive Load Shedding algorithm is an advanced algorithm available with the Tmax XT as an enhancement of the basic version. The intelligent software embedded in the unit sheds the non-priority loads very quickly according to the microgrid power consumption and frequency measurements. Moreover, the software has a dedicated configuration for backup generation related to Automatic Transfer Switching (ATS) and the software itself is even able to estimate the energy produced by a solar plant based on the plant geography settings.

Load Shedding is available on the Tmax XT platform sharing some information about the loads under control in the plant.

Application examples

- **Grid-connected plants with running GenSets**
These contribute to self-consumption together with potential renewable sources and support the load power supply in emergency conditions. This is the case for hybrid photovoltaic diesel remote communities connected to weak distribution grids where there are a lot of daily faults, or facilities located in geographical areas where there are frequent environmental events, for example hurricanes or earthquakes.
- **Grid-connected plants with back-up GenSets**
These are started up after main generator transfer switching logics and require high reliability. For example, hospitals, banks or data centers.

Load Shedding

Benefits

Thanks to Tmax XT with the embedded Load Shedding innovations, the following benefits are guaranteed:

Service continuity

When a plant remains disconnected from the main grid, even if local generation is present, there is a significant stress that may imply that the generators fail with a consequent blackout.

Load Shedding logic embedded in the Tmax XT reduces the frequency drop that usually makes the local generation protection trip, maintaining a live plant.

Space saving

- No other programmable logic controllers (PLCs) are needed as the Tmax XT has embedded intelligence for the load shedding logics, taking advantage of the current and voltage sensors for electrical parameter measurements.
- In addition, static converters for low voltage photovoltaic production typically have anti-islanding protection: this implies another power deficit to be added to the main grid contribution during the microgrid islanding. The Tmax XT estimates solar production without additional sensors.

- The Load Shedding algorithm is suitable with ATS architectures to distinguish priority and non-priority loads.

Where feasible, a BusTie switching device is no longer required and this means:

- Significant space and material savings of up to 50% in the power distribution switchgear for panel builders.
- The Load Shedding algorithm is self-tuned with specific power unbalance identification and dynamically chooses the controllable loads to be shed, reducing constraints for consultants during plant design.
- The ATS unit only manages two sources, without interlock, logic programming or wiring connections for the third circuit-breaker with less time required for installation.

Ease of use

Load shedding logic is generally set using top engineering skills and customization efforts with devices as programmable logic controllers.

The Tmax XT guarantees easy installation thanks to predefined templates and the user-friendly graphic interface in the software commissioning tool.

Typical Load Shedding application

Automatic Transfer Switch (ATS) function

The Tmax XT is ready for transfer switching applications reducing time

The ATS solution

ABB Automatic Transfer Switch system (ATS) takes advantage of the new capabilities provided by the new Ekip Connect 3 Software with intelligent digital units such as the Tmax XT to deliver versatile and reliable solutions.

Application example

Automatic transfer switch systems are common in all applications where service continuity is essential and where there are multi source supplies.

The main applications are:

- Power supplies of UPS groups
- Oil & Gas
- Operating theatres and primary hospital services
- Emergency power supplies for civil buildings, hotels and airports
- Data banks and telecommunication systems
- Power supply of industrial line for continuous processes.

An ATS can be used also whenever a portion of a grid with local generation, known as a microgrid, can be disconnected from the main grid.

ATS application example

Automatic Transfer Switch (ATS)

The ATS is a high-performing energy automation system, easy to install

Benefits

Ready-to-go programming

Estimated time and cost savings on the ATS engineering on a low voltage project: 95%.

Tmax XT compactness

Space saving on the power switchboard: up to 30%.

Simplify the connections

Estimated time and cost savings on cabling and commissioning of the power switchboard: 50%.

Top rate reliability

With watchdog functions and fewer installed components.

Accessories

Execution and installation

- 7/4 Fixed, plug-in and withdrawable version
- 7/6 Conversion kits
- 7/6 Connectors for electrical accessories
- 7/9 Bracket for fixing on DIN-rail
- 7/9 Motorizable version

Power connection

- 7/10 Connection terminals

Signaling

- 7/18 Auxiliary contacts - AUX
- 7/19 Auxiliary Position Contacts - AUP

Execution and installation

Fixed, plug-in and withdrawable version

SACE Tmax XT circuit-breakers are available in the following versions:

Fixed circuit-breaker

Plug-in circuit-breaker

Withdrawable circuit-breaker

- FIXED**
 Fixed circuit-breakers consist of a current-interrupting part connected to the trip unit, to be installed on the back plate of the cubicle or on a DIN-rail;
- PLUG-IN**
 Plug-in circuit-breakers consist of a fixed part that must be installed on the back plate of the cubicle, and of a moving part, obtained from the fixed circuit-breaker plus the relative kit that converts it from the fixed version into the moving part of the plug-in version;
- WITHDRAWABLE**
 Withdrawable circuit-breakers consist of a fixed part that must be installed on the back plate of the cubicle equipped with side runners to allow the moving part to be easily racked -in and -out. Such a solution is obtained from the fixed circuit-breaker plus the relative kit that converts it from the fixed version to a withdrawable moving part. To obtain the withdrawable version, a front accessory to be applied to the front of the circuit-breaker must be ordered so as to maintain the IP40 degree of protection over the entire disconnection run of the circuit-breaker (except for the XT7). This mandatory accessory is a standard supply for circuit-breakers fitted with accessories in the factory.

If the plug-in circuit-breaker is fitted with electrical accessories, the appropriate connectors for disconnection of the relative auxiliary circuits must also be ordered. For the withdrawable version there are dedicated accessories, fitted with connectors, which allow automatic disconnection in the case of racking-out. Starting from the fixed version, the SACE Tmax XT circuit-breakers can be easily converted into plug-in and withdrawable versions by using the relative conversion kits.

The moving parts can always be obtained for the required version, fully pre-engineered from the factory, by ordering the fixed circuit-breaker and the conversion kit at the same time.

	Version		
	Fixed	Plug-in	Withdrawable
XT1	■	■	-
XT2	■	■	■
XT3	■	■	-
XT4	■	■	■
XT5	■	■	■
XT6	■	-	■
XT7	■	-	■
XT7 M	■	-	■

The fixed version, which is connected directly to the power system through the circuit-breaker terminals, is recommended for applications in which the need for space can be satisfied by compact products without affecting the performance.

The plug-in version is recommended for applications for which service continuity is a fundamental requirement: the replacement of the moving part with a new one does not require any intervention on the power supply connections.

The withdrawable version, in addition to the advantages of the plug-in version, offers three different positions:

- connected: power and auxiliary circuits are connected
- test: power circuits are disconnected, while auxiliary circuits are connected (only for XT5, XT6 and XT7)
- disconnected: both power and auxiliary circuits are disconnected.

Fixed part of plug-in and withdrawable versions

The fixed part of the plug-in/withdrawable versions is available with front terminals (EF), with horizontal rear terminals (HR) or with vertical rear terminals (VR). The terminals are factory mounted in the horizontal position if the code is shared between HR and VR. In this case, it is possible to easily rotate the terminals into the vertical position. For the XT5 and XT6 circuit-breakers, the fixed part can be fully pre-engineered in the factory with the required combination of terminals, by ordering the dedicated configurable fixed part code and the terminals at the same time.

These fixed parts can be equipped with the same terminals, terminal-covers and phase separator kits used for the fixed circuit-breakers, using the proper adapter (see the "Power connection" section). For Tmax XT1, XT2, XT3, XT4 and XT5 400A, the fixed part of a plug-in/withdrawable circuit-breaker can be installed at two different distances from the back of the panel, according to the picture below. For XT1, XT2, XT3 and XT4, installation at 1.96 in is only compulsory in the case where rear horizontal or vertical terminals (HR/VR) are used.

Execution and installation

Conversion kits

The following conversion kits can be ordered for the different versions. This is applicable to the whole Tmax XT family, up to Tmax XT6.

Conversion kit for converting a fixed circuit-breaker into the moving part of a plug-in circuit-breaker

- **Kit for converting a fixed circuit-breaker into the moving part of plug-in/withdrawable versions**

The conversion kit converts a fixed circuit-breaker into a moving part of the plug-in/withdrawable versions. When withdrawable versions are required, it is essential to order an accessory for the front of the circuit-breaker to maintain the IP40 degree of protection along the entire insulation run. This accessory is made of the following options:

- front for the lever operating mechanism (FLD);
- motor operator (MOE);
- direct or transmitted rotary handle operating mechanisms (RHD or RHE).

In the case where no accessory to be applied onto the front is indicated, the front for the lever operating mechanism (FLD) is automatically included in the order.

Conversion kit for converting a fixed circuit-breaker into the moving part of a withdrawable circuit-breaker

- **Kit for converting a fixed part of a plug-in version into the fixed part of withdrawable versions**

The kit comprises:

- a guide for transforming the fixed part of the plug-in circuit-breaker into a fixed part of a withdrawable circuit-breaker;
- a racking-out lever that allows the moving part to be inserted and withdrawn. The mechanism allows the circuit-breaker to be set to the disconnected position (with the power and auxiliary circuits disconnected) with the compartment door closed, which is an advantage for operator safety. The rotary handle can only be inserted when the circuit-breaker is open. Once it has been removed or withdrawn, the circuit-breaker can be set to the open/closed position;
- a flange for the compartment door, which replaces the one supplied with the fixed version of the circuit-breaker.

Conversion kit for converting a fixed part of plug-in version into the fixed part of a withdrawable version

- **Kit for converting a fixed circuit-breaker into the plug-in version for RC Sel residual current devices for XT2-XT4-XT5**

The RC Sel 4-pole residual current devices for the XT2, XT4 and XT5 can be converted from fixed versions to plug-in versions using the special kit.

- **Kit for converting plug-in circuit-breakers into withdrawable versions for RC Sel residual current devices for the XT2-XT4-XT5**

The RC Sel 4-pole residual current devices for the XT2, XT4 and XT5 can be converted from the plug-in version to the withdrawable version using a special kit, which includes a component to apply to the front of the residual current device so as to allow it to be withdrawn when the panel door is closed. This kit can also be assembled on fixed circuit-breakers equipped with a front for a lever operating mechanism or the direct rotary handle, thus allowing the use of residual current devices.

In the plug-in to withdrawable conversion kit, there are also PIN connectors to be applied onto the right side of the circuit-breaker to facilitate disconnection of the auxiliary circuits connected to the residual current device.

For the XT1, XT2, XT3 and XT4, this kit also contains the opening solenoid of the residual current device dedicated to the withdrawable version, which is fitted with a connector for the fixed part and the moving part.

For the SACE Tmax XT7 and XT7 M there is a dedicated conversion kit to transform a fixed circuit-breaker into the moving part of the withdrawable version. No additional accessory is required.

(1) Frontal accessory mandatory. If not specified in the order, the FLD is supplied automatically

Execution and installation

Connectors for electrical accessories

Plug-in circuit-breaker

In the plug-in version of the SACE Tmax XT circuit-breakers, the auxiliary circuits can be disconnected by means of two different types of adapter:

- a plug and socket to be fixed on the bottom of the panel: for the XT1, XT2, XT3, XT4 and XT5;
- a plug and socket installed on the rear of the circuit-breaker and in the fixed part of the plug-in devices: for the XT2, XT4 and XT5.

Plug and socket on the back of the panel

To make it easier to connect/disconnect the auxiliary circuits, wired electrical accessories can be connected to one or more plug and socket connectors on the back of the panel.

3, 6, 9 and 15 PIN connectors are available. The cables connect/disconnect the auxiliary circuits in a fast and simple way without the aid of any dedicated tools.

Consider the number of cables of each electrical accessory when calculating the number of connectors required.

Plug and socket adapters on the back of the panel

8	-	MOE (with AUX-MO)

(1) Ekip Com for Ekip LSI, LSIG and M-LRIU

Plug and socket adapters on the rear of the circuit-breaker and inside the fixed part

For the plug-in versions of the XT2, XT4 and XT5 circuit-breakers, the auxiliary circuits can be automatically disconnected by means of an adapter installed on the rear of the circuit-breaker and inside the fixed part of plug-in versions.

The 12 PIN connector can be used only with accessories functioning at a voltage lower than 250V AC/DC. The cables connect/disconnect the auxiliary circuits in a fast and simple way without the aid of any dedicated tools. Wiring is to be carried out by the Customer.

—
Cabling of withdrawable versions

Withdrawable circuit-breaker

When withdrawable circuit-breakers are used, the codes of the electrical accessories specifically designed for this version must be ordered. These dedicated codes include the wired electrical accessory with a connector for the moving part and for the fixed part to be inserted on the side of the fixed part. If the MOE motor operator is ordered, connectors for the fixed part and moving part are always supplied since there is no dedicated code for the withdrawable version. This type of connection allows the auxiliary circuits to be disconnected automatically when the circuit-breaker is withdrawn from the fixed part. If cabling of the fixed part is required before wiring the moving part, the fixed part mounting connectors can be ordered as spare parts.

XT7 and XT7 M

Two different areas for the auxiliary connection terminal boxes can be clearly identified on the top of the XT7 and XT7 M circuit-breakers:

- The terminal area housing the terminals for wiring the auxiliary connections. The terminals can be wired first and then installed in the circuit-breaker terminal box, thereby facilitating cable connection for the operator;
- The cartridge modules area, housing the Ekip modules. These are installed directly on the upper part of the circuit-breaker without removing the Ekip electronic trip unit, thereby minimizing the time required for the installation and commissioning of accessories.

These areas are the same also in case of withdrawable versions.

Bracket for fixing on DIN-rail

This is a support designed to be installed on the back of the circuit-breakers to simplify assembly on standardized DIN EN 50022 rails.

The following circuit-breakers can be installed on the DIN EN 50022 rail:

- XT1, XT2, XT3 and XT4 circuit-breakers in the fixed 3-pole or 4-pole versions;
- XT1, XT3 circuit-breakers equipped with RC Sel 200; RC Inst, RC Sel for XT1 and XT3 residual current releases.

—
Bracket for fixing on DIN-rail

Motorizable version

The XT7 M can be equipped with a spring charging motor. To allow complete remote control with the XT7 M, the circuit-breaker must be fitted with:

- A shunt opening release (YO)
- A shunt closing release (YC)
- A spring charging motor (M)

(1) From XT1 to XT6, the same terminals of fixed circuit-breakers can be mounted on the fixed part if the adapter is installed.

(2) For the XT5 600A and the XT6 fixed part, the HR and VR have different codes

Connection terminals

Connection terminals allow the circuit-breaker to be connected to the system in the way most suitable for the installation requirements. They consist of:

- front terminals: for connecting cables or busbars directly from the front of the circuit-breaker;
- rear terminals: for installing circuit-breakers in segregated panels with rear access.

Where possible, the terminals have a laser marking on the surface indicating the tightening torques for the correct insulation of cables and bars.

Fixed version

The standard fixed version of the SACE Tmax XT circuit-breakers are supplied with front terminals (F). However, they can be fitted with the following types of terminals as accessories thanks to the special kits:

- extended front (EF);
- extended spread front (ES);
- front for copper/aluminium cables (FCCuAl). A pitch adapter must be applied to the terminal zone of the circuit-breaker to ensure that copper and aluminium cables can be connected to all the circuit-breakers. The pitch adapter is automatically supplied when it is necessary;
- front for copper cables (FCCu);
- for flexible busbars (FB);
- multicable (MC);
- rear oriented (R).

—
Fixed part adapters

Plug-in and withdrawable versions

The fixed part of the plug-in and withdrawable versions of the XT1, XT2, XT3 and XT4 circuit-breakers are normally supplied with extended front terminals (EF) or horizontal/vertical rear terminals (HR/VR).

The terminals are factory-mounted in the horizontal position. If needed, the customer can easily rotate the terminals into the vertical position. A fixed part with front terminals (EF) can be converted into a fixed part with rear terminals (HR/VR) by ordering the appropriate terminal kit.

The fixed part of the plug-in and withdrawable versions of the XT5 and XT6 circuit-breakers can be accessorized directly when ordering with extended front terminals (EF) or horizontal/vertical rear terminals (HR/VR), that can be different from the top and bottom terminals.

The terminals are factory-mounted in the horizontal position. If needed, the customer can easily rotate the terminals into the vertical position. For the XT5 600A and the XT6 fixed part, the HR and VR terminals are different and not interchangeable.

The fixed parts can also be fitted with the same types of terminals available on the fixed circuit-breaker after an adapter has been installed on the terminal area of the fixed part itself. Consequently, the following types of connection terminals are also available for the fixed part:

- extended spread front (ES);
- for copper-aluminium cables (FCCuAl);
- for copper cables (FCCu);
- for flexible busbars (FB);
- multi-cable (MC).

The adapter reproduces the terminal area of the fixed circuit-breaker. This means that the fixed parts can also be equipped with the same terminal covers and phase separators as those used for fixed circuit-breakers. In order to mount terminals on the adapter, the front terminals "F" kit provided with the circuit-breaker is needed.

Fixed part adapter

Circuit breakers	"H1 fixed part [mm/in]"	"H2 circuit breaker [mm/in]"	"H3 fixed part with two adapters [mm/in]"
XT1	146/5.75	134/5.28	181/7.13
XT2	153/6.02	134/5.28	188/7.40

Auxiliary contacts - AUX

The SACE Tmax XT circuit-breakers can be equipped with auxiliary contacts that signal the status of the breaker and can be routed outside the circuit-breaker itself. The following information is available:

- **open/closed (Q):** indication of the status of the circuit-breaker power contacts;
- **trip (SY):** signals that the circuit-breaker is opening due to the intervention of the trip unit, or to the intervention residual current device, or to the opening of undervoltage/shunt opening releases, or to the use of the emergency opening pushbutton of the motor operator, or to the use of the test button;
- **trip unit tripping (S51):** indicates that one of the protection functions of the electronic or thermal-magnetic trip unit has tripped. In case of the Tmax XT5 equipped with thermal-magnetic trip unit and residual current device, S51 is activated also by the intervention of the residual current device.
- **YO/YU tripping (S52):** indicates that the under voltage or shunt opening release has been activated. The signaling depends on the service release used. For Tmax XT6 S52 can be used only with YU and is not available for YO. For Tmax XT5, in case of YO, shunt opening release must be permanently supplied to maintain the S52 signal.

Cabled auxiliary contact

Uncabled auxiliary contact

Cabled auxiliary contact for withdrawable circuit-breaker

250V AC/DC and 24V AC/DC auxiliary contacts are installed without the need for any screws. They are extremely easy to fit. Simply apply a slight pressure in the appropriate place. The following versions of auxiliary contacts are available:

- cabled (AWG20 cable section -0.5mm²):
 - for fixed/plug-in circuit-breakers with 3.28ft long cables;
 - for withdrawable circuit-breakers with fixed part and moving part connector;
- not cabled:
 - for fixed/plug-in circuit-breakers with cables from AWG 20 up to AWG 15 cross-section.

Auxiliary contacts are supplied for each circuit-breaker in the SACE XT family in various different combinations, as shown in the table. The following items can be ordered to make the installation even more flexible:

- an uncabled auxiliary contact can generate different signals (Q, SY or S52) according to the position where the circuit-breaker is installed;
- an uncabled S51 auxiliary contact, which can be used for XT2, XT4, XT5 and XT6 circuit-breakers;
- a cabled auxiliary contact, with unnumbered cables. It can generate different signals (Q, SY or S52) according to the position where the circuit-breaker is installed.

The AUX 15Q is an alternative to the mechanical interlock (MI), the DLC for XT7 M lock or the DLP lock if mounted on the right side.

Open and close auxiliary contacts

15 auxiliary contacts

Trip auxiliary contact - SY

The XT7 circuit-breakers can be equipped with auxiliary contacts that signal that the circuit-breaker is opening due to the intervention of the trip unit, or to the opening of undervoltage/shunt opening releases, or to the use of the test button. The contacts are available in the following configurations:

		400V/250V AC/DC contact	24V DC contact
Type		Switching	Switching
Minimum load		100mA @ 24V	1mA @ 5V
Breaking capacity			
DC	24V	-	0.1A
	125V	0.3A	-
	250V	0.15A	-
AC	250V	12A	-
	400V	3A	-

Contact signaling the tripping of the protection unit Ekip – S51

This contact signals the opening of the circuit-breaker after the Ekip protection trip unit has tripped.

The contact is available for the XT7 and XT7 M.

For the XT7 M circuit-breaker, the closing operation can be carried out only after the “TU Reset” push-button has been restored to its normal operating position. The switching contact can also be associated with an optional accessory for remote resetting - YR.

		250V AC/DC contact	24V DC contact
Type		Switching	Switching
Minimum load		100mA @ 24V	1mA @ 5V
Breaking capacity			
DC	24V	-	0.1A
	250V	0.5A @ 0ms / 0.2A @ 10ms	-
	AC	250V	3A @ cos Φ 0.7

Contact signaling the tripping of the Ekip trip unit protection - S51

Contact signaling tripping of the YO2/YU – S52

This contact signals that the undervoltage (YU) or the shunt opening release (YO2) have been activated. The contact is the same and depends on the service release mounted in the dedicated position.

It is available for the XT7 only, with YU/YO2 installed in the dedicated slot.

Auxiliary contact S52 doesn't read the tripping of the YO.

		250V AC/DC contact	24V DC contact

Signaling

Auxiliary Position Contacts – AUP

Auxiliary position contacts provide information about the position of the circuit-breaker in relation to the fixed part of plug-in or withdrawable versions.

Three types of position contacts (AUPs) are available:

- racked-in contact for all plug-in and withdrawable Tmax XT circuit-breakers;
- racked-out contact for all withdrawable Tmax XT circuit-breakers;
- test contact for withdrawable Tmax XT5, XT6, XT7 and XT7 M circuit-breakers.

Circuit-breaker		Max number of racked-in contacts	Max number of test contacts	Max number of racked-out contacts	Max number of AUP
XT1	3/4 poles	4	-	-	4
XT2	3 poles	2	-	2	4
	4 poles	4	-	2	6
XT3	3/4 poles	4	-	-	4
XT4	3/4 poles	4	-	2	6
XT5	3/4 poles	3	1	1	5
XT6	3/4 poles	3	1	1	5
XT7	3/4 poles	2	2	2	6
XT7 M	3/4 poles	2	2	2	6

Auxiliary position contacts, which provide electrical signaling of the circuit-breaker position in relation to the fixed part, are available in the following versions:

AUP	XT1	XT2	XT3	XT4	XT5	XT6	XT7	XT7 M
24V DC	■	■	■	■	■	■	■	■

Auxiliary position contacts - AUP

Signaling

—
Early Auxiliary Contacts

Early Auxiliary Contacts – AUE

Early closing auxiliary contacts: these allow the undervoltage release to be supplied before the main contacts close, in accordance with IEC 60204-1 and VDE 0113 standards. Early opening auxiliary contacts: these allow any electronic devices connected to the system to be disconnected in advance before the system is damaged by an overvoltage caused by the circuit-breaker opening. The early opening/closing auxiliary contacts can be installed inside the direct and transmitted rotary handle operating mechanisms for all the SACE Tmax XT family circuit-breakers except for the XT7 (max two contacts @ 400V):

- the cabled version includes 3.28ft long cables (AWG20 cable sections);
- a dedicated code is available in the withdrawable version which includes the connector for the moving and fixed parts;

For the XT7 with a lever operating mechanism, these are mounted directly on the circuit-breaker.

— Ready to close signaling contact

Ready to close signaling contact - RTC

The ready to close signaling contact – RTC – indicates that the circuit-breaker is ready to receive the closing command and is available only for the XT7 M. The circuit-breaker is ready to close when the following conditions are fulfilled:

- the circuit-breaker is open
- the springs are loaded
- there are no opening command or locks on the opening command
- the circuit-breaker is reset following tripping of the Ekip protection trip unit.

Mechanical signaling of tripping the protection trip unit - TU Reset

XT7 M circuit-breakers are always equipped with a mechanical device that signals the tripping status of the protection trip units. After the Ekip trip unit has been tripped due to an electrical fault, the signaling device clearly indicates the tripping status on the front of the circuit-breaker. The circuit-breaker can be reset only after the signaling pushbutton has been restored to its normal operating position.

(1) Available in standard and emergency version; (2) Compatible only with RHE_MB

Rotary handle operating mechanism

This is an operating device that allows the circuit-breaker to be operated by means of a rotary handle, which makes the circuit-breaker easier to open and close thanks to its ergonomic handgrip.

Different types of handles are available:

- direct (RHD): installed on the front of the circuit-breaker for frontal operation;
- transmitted (RHE): installed on the panel door. It allows the circuit-breaker to be operated by means of a rod which acts on a base installed on the front of the circuit-breaker. A version (RHE-PL) with padlock on the base is also available; also an heavy duty version called RHE_MB is available;
- lateral (RHS): installed directly on the front of the circuit-breaker for side operations.

For the XT1, XT2, XT3 and XT4 a large handle grip (LH) is also available, which can be combined with the transmitted handle (RHE) and with the lateral handle (RHS).

(1) Available for XT5 only

Operating mechanism

All rotary handles are available in two versions:

- standard: grey color;
- emergency color: red on a yellow background. Suitable for operating machine tools.

Transmitted rotary handles can be ordered in the following ways:

- by one single commercial code (for RHD, RHE, RHS L/R);
- by listing the commercial codes of the following three components (for RHE only):
 - the base of the rotary handle to be fixed onto the circuit-breaker (RHE_B or RHE_MB);
 - a 19.68in transmission rod (RHE_S). The minimum and maximum distances between the fixing plate and the door are 2.38in and 18.5in respectively;
 - a rotary handle on the compartment door with a normal standard handgrip (RHE_H, RHE_H LH) or emergency handgrip (RHE_H_EM, RHE_H_EM LH).

To install the lateral rotary handle (RHS) on the XT5, the transmitted rotary handle (RHE code) and the conversion kit (from RHE to RHS) must be ordered.

The use of the rotary handle is an alternative to the motor operator and to all accessories mounted on the front of the circuit-breaker.

The rotary handles can be locked by means of a wide range of key locks and padlocks (see the Chapter "Safety and Protection" - section "Locks").

The direct and transmitted rotary handle operating mechanisms allow early closing auxiliary contacts to be used when closing to supply the undervoltage release before the circuit-breaker closes.

For XT5, XT6 and XT7 there is a special version of the RHD and RHE_B with an additional padlock (2PLL).

For XT1 and XT4 there is a special version of RHE with an additional padlock on the base (2PLL).

For heavy duty applications, where a stronger solution is needed, the metallic base mechanism (RHE_MB) is available for XT1 to XT4. This base mechanism is completely in metal and is able to resist to a stronger application force. It has the padlock directly embedded on the base. It can be used with the RHE_S plus either RHE_H or RHE_LH in order to get the complete RHE solution. However, it can be used also with the OT handles and shafts available in the "Ordering Code" Chapter. Also a shaft support is available (RHE_SS) - as optional - to be used for RHE_MB only.

Conversion kit for telescopic rod

This device must be installed on the rod of the extended rotary handle (RHE) and allows the panel door to be closed even with the withdrawable circuit-breaker in the racked-out position.

Operating mechanism

Flange handle

Flange handle

Installed on the panel door. It allows fixed circuit breakers to be operated in accordance with NFPA and UL508A Standards by means of cables of different length, which act on a base installed on the front of the circuit breaker. Two different versions of handles are available in order to fully meet the Standard prescriptions required by the application.

NFPA handle

NFPA handle

Thanks to this handle mounted on the shaft of the RHE mechanism, the operator is allowed to operate the circuit breaker and to lock it in OFF position by means of an embedded padlock device also in case of panel door open, as prescribed by the Standards NFPA 79 and UL508A.

Front for the operating lever mechanism

Front for the lever operating mechanism

This device can be installed on the front of the circuit-breaker and for withdrawable circuit-breakers inside switchboards, it allows the IP40 degree of protection to be maintained for the whole insulation run of the circuit-breaker.

It is always fitted with a compartment door lock and with a slot for a padlock device in the open position (0.236in Ø stem up to three padlocks - not supplied) which prevents closing the circuit-breaker and the compartment door.

The front for the lever operating mechanism can only be installed on the XT2, XT4, XT5 and XT6 circuit-breakers. The front for the lever operating mechanism can be fitted with a wide range of key locks and padlocks (see the Chapter "Safety and Protection" - section "Locks").

The use of the front for the lever operating mechanism is an alternative to the motor operator and to all of the front type accessories.

Toggle extension for XT5-XT6

Toggle extension for XT5-XT6

This device can be used to easily operate the toggle of the circuit-breaker, during manual closing and opening operations.

The device is removable and does not need screws in order to mount and operate it.

Foldable handle for XT7

This device can be used to reduce the installation depth of XT7. It can be mounted instead of the standard toggle and folded on a side after using.

Service releases

The SACE Tmax XT circuit-breakers can be fitted with service releases (shunt opening release, shunt closing release for XT7M only and undervoltage release).

XT1, XT2, XT3 and XT4

Shunt opening release – SOR

This allows the circuit-breaker to open by means of a non-permanent electrical control. Release operation is guaranteed for voltage between 70% and 110% of the rated power supply voltage U_n , in both alternating and direct current. The SOR is equipped with a built-in limit contact to shut-off the power supply in the open position with the trip unit tripped.

A remote-controlled emergency opening command can be generated by connecting an opening button to the SOR.

Cabled SOR - UVR

Cabled SOR - UVR for withdrawable circuit-breaker

Uncabled SOR - UVR

Undervoltage release – UVR

This allows the circuit-breaker to open when the release is subject either to a power failure or a voltage drop. As prescribed in the Standards, opening is guaranteed when the voltage is between 70% to 35% U_n . After tripping, the circuit-breaker can be closed again if the voltage exceeds the 85% U_n . When the undervoltage release is not energized, neither the circuit-breaker or the main contacts can be closed. A remote-controlled emergency opening command can be generated by connecting an opening button to the UVR.

None of the service releases require screws for installation. They are extremely easy to fit. Just use slight pressure in the appropriate place. All service releases are available in two versions:

- cabled (AWG 20 cable section - 0.5mm² up to 300V, AWG 17 - 1mm² up to 525V):
 - for fixed/plug-in circuit-breakers with 3.28 ft long cables;
 - for withdrawable circuit-breakers with a fixed and moving part connector;
- not cabled:
 - for fixed/plug-in circuit-breakers with cables from AWG 15 in cross-section.

Remote control

Installation in circuit-breakers:

- 3-pole: as an alternative, the SOR or UVR can be installed in the slot on the left of the operating lever;
- 4-pole: the SOR or UVR can be housed at the same time in the slot of the third and fourth pole. For withdrawable circuit-breakers, the connector for the fourth pole must be ordered to be able to install the SOR and UVR in the fourth pole. If there is a residual current release, the opening solenoid (RC SA) of the residual current device must be installed in the slot of the third pole on the left of the operating lever.

SOR Electrical specifications

Version	Max power absorbed on inrush		Resistance	
	AC [VA]	DC [W]	Internal [ohm]	External [ohm]
12V DC		50	2.67	0
24-30V AC/DC	50	50	11	0
48-60V AC/DC	60	60	62	0
110...127V AC-110...125V DC	50	50	248	0
220...240V AC-220...250V DC	50	50	930	0
380-440V AC	55		2300	0
480-525V AC	55		5830	0
Opening time (SOR)				
XT1, XT2, XT3 and XT4	30ms			

UVR Electrical specification

Version	Power absorbed during normal operation		Resistance	
	AC [VA]	DC [W]	Internal [ohm]	External [ohm]
24-30V AC/DC	1.5	1.5	399	0
48V AC/DC	1	1	1447	100
60V AC/DC	1	1	2405	100
110...127V AC-110...125V DC	2	2	8351	390
220...240V AC-220...250V DC	2.5	2.5	20502	9000
380-440V AC	3		20502	39000
480-525V AC	4		20502	59000
Opening time (UVR)				
XT1, XT2, XT3 and XT4	30ms			

XT5 and XT6**Shunt opening release – YO**

This allows the circuit-breaker to open by means of a permanent electrical control. Release operation is guaranteed for voltages between 70% and 110% of the rated power supply voltage U_n , in both alternating and direct current. The YO can be permanently supplied.

A remote-controlled emergency opening command can be created by connecting an opening button to the YO.

Undervoltage release – YU

This allows the circuit-breaker to open when the release is subject either to a power failure or a voltage drop. As prescribed in the standards, opening is guaranteed when the voltage is between 70% to 35% U_n . After tripping, the circuit-breaker can be closed again if the voltage exceeds 85% U_n . When the undervoltage release is not energized, neither the circuit-breaker nor the main contacts can be closed. A remote-controlled emergency opening command can be generated by connecting an opening button to the YU.

None of the service releases require screws to be installed. They are extremely easy to fit: just use a slight pressure on the part indicated in the installation manual. All service releases are available in two versions:

- cabled (AWG16 - minimum cable section 1.25mm²):
 - for fixed/plug-in circuit-breakers with 3.28ft long cables;
 - for withdrawable circuit-breakers with fixed and moving part connectors;
- not cabled:
 - for fixed/plug-in circuit-breakers (suggested cables section 1.5 mm² AWG15).

For the fixed version of Tmax XT5, the YO and the YU can be mounted as an alternative in the slot on the left (third pole) or in the slot on the right (first pole) of the operating lever. For the withdrawable version of Tmax XT5, the YO and YU are installed as standard in the first pole. If two different coils are needed in the same circuit-breakers or the YO or YU are required in the third pole (on the left), an uncabled coil and the dedicated cables and connectors for the withdrawable version must be ordered.

Instead, for Tmax XT6 in each versions (withdrawable or fixed) YU can be mounted only in the third pole (on the left) and YO can be mounted only in the first pole (on the right).

—
Shunt opening release

XT7 and XT7M

Shunt opening and shunt closing releases - YO/YC

These opening and closing releases enable the circuit-breaker to be controlled remotely. Opening is always possible, while closing is available only for the XT7 M when the closing springs of the operating mechanism are loaded and the circuit-breakers are ready to close. The releases operate by means of minimum impulse current duration time of 100 ms. Furthermore, they can operate in permanent service. In this case, if the opening command is given by means of the opening release, the circuit-breaker can be closed by de-energizing the opening release and, after a time of at least 30 ms, by controlling the closing.

A second open release is an alternative to an undervoltage release.

Remote control

Undervoltage release

Undervoltage release – YU

The undervoltage release opens the circuit-breaker when there is a significant voltage drop or power failure. It can be used for safe remote tripping, for blocking closing or to control the voltage in the primary and secondary circuits. The power supply for the release is therefore obtained from the supply side of the circuit-breaker or from an independent source.

Circuit-breaker closing is permitted only when the release is powered. The undervoltage release is an alternative to the second shunt opening release.

As prescribed in the Standards, opening is guaranteed when the voltage is between 70% to 35% U_n . After tripping, the circuit-breaker can be closed again if the voltage exceeds the 85% U_n .

110V	■	■
220V	■	■
Operating limits	90%...110% Un	

Opening and closing release test unit - YO/YC Test Unit

The opening and closing release test unit helps ensure that the releases are running smoothly, to guarantee a high level of reliability in controlling circuit-breaker opening. The test unit ensures the service continuity of the opening and closing releases with a rated operating voltage between 24V and 250V (AC and DC), in addition to verifying the functioning of the opening and closing coils electronic circuit. Continuity is checked cyclically at an interval of 30s between tests. The unit has optic signals via LEDs on the front, which provide the following information:

POWER ON: correct power supply of the YO/YC Test Unit;

OPEN ON: coil switch absent, power supply absent or insufficient, interrupted cables;

SHORT ON: coil switch failure, short-circuited cables;

OPEN and SHORT FLASHING: faulty coil switch or incorrect supply;

OPEN and SHORT OFF: correct operation of the coil switch.

Two relays with one change-over area are also available on board the unit, to allow remote signaling of the following events:

Test failure - resetting takes place automatically when the alarm stops;

Failure of three tests - resetting occurs only by pressing the manual RESET on the unit.

Devices characteristics

Auxiliary power supply	24...250V AC/DC
------------------------	-----------------

Specifications of the signaling relays

Maximum interrupted current	6A
Maximum interrupted voltage	250V AC

Remote control

Time delay device for undervoltage release

Electronic time-delay device for undervoltage release - UVD

The undervoltage release can be combined with an electronic time-delay device for the circuit-breaker, allowing for delayed external tripping with adjustable preset times. Use of the delayed undervoltage trip unit is recommended to prevent tripping when the power supply network for the trip unit is subject to brief voltage drops or power supply failures. Circuit-breaker closing is inhibited when the UVD is not powered. The time-delay device must be used with an undervoltage release with the same voltage.

Motor Operators

These are devices that allow circuit-breaker opening and closing:

- in remote mode, by means of electric controls;
- locally, directly from the front, by means of a special mechanism.

Direct action motor operator - MOD

Direct action motor operator (MOD)

Remote control

The direct action motor operator available for XT1 and XT3 is supplied:

- with 3.28 ft long cables;
- with a flange, to replace the standard one supplied with the circuit-breaker;
- with a padlock device, only removable when the motor is in the open position. The padlock device accepts up to three 0.3 in padlocks;
- auxiliary contacts (AU-MO), which allow the motor control mode (manual or auto) signal to be routed outside;
- (on request) the motor operator can be fitted with a key lock (see the Chapter "Accessories" - section "Locks").

Operating principles:

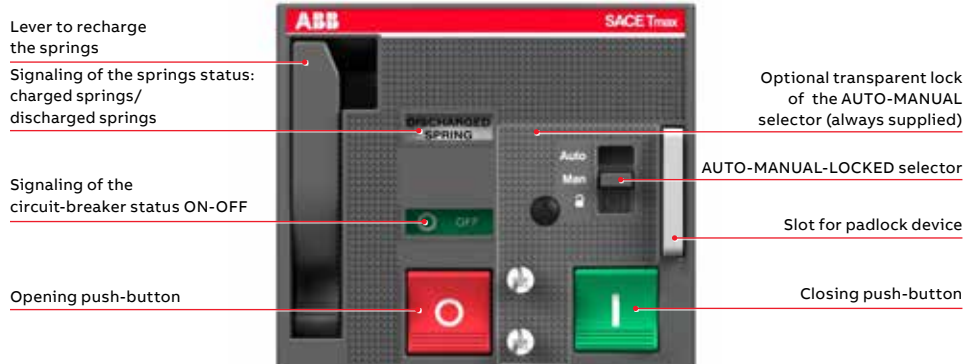

- a selector on the front of the MOD, is used for selecting the operating mode:
 - **AUTO:** when the selector is in this position, the circuit-breaker closing is commanded remotely only by means of an electric impulse, whereas opening is allowed both remotely and from the front of the motor;
 - **MANUAL:** when the selector is in this position, the circuit-breaker can only be opened/closed from the front of the motor by means of the relative lever housed in a slot made in the motor itself;
- via remote control, guaranteed by permanent electrical opening/closing impulses.

Stored energy motor operators - MOE and MOE-E XT2-XT4

Stored energy motor operators (MOE)

The MOE or MOE-E stored energy motor operator available for XT2 and XT4 is supplied:

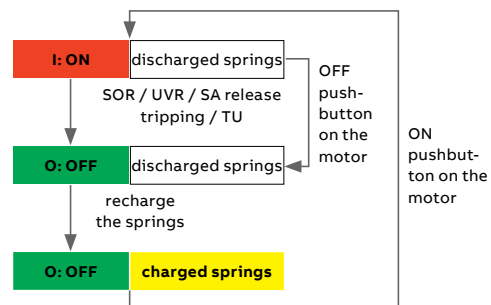

- with 3.28 ft long cables;
- with connectors for the fixed part and moving part of withdrawable devices. If the motor operator is used with fixed or plug-in circuit-breakers, the connector can be easily removed;
- with a flange, to be used instead of the standard one supplied with the circuit-breaker;
- with a padlock device, which is only removable when the motor is in the open position. The padlock device accepts up to three 0.3in padlocks;
- with a lock for the AUTO-MANUAL selector;
- with auxiliary contacts (AUX-MO) that allow the motor control mode (manual or remote) signal to be routed outside;
- (on request) the motor operator can be equipped with a key lock (see the Chapter "Accessories" - section "Locks");
- (on request) the motor operator can be equipped with a key lock to safeguard against manual operation (MOL-M) (see the Chapter "Accessories" - section "Locks").

Operating principles:

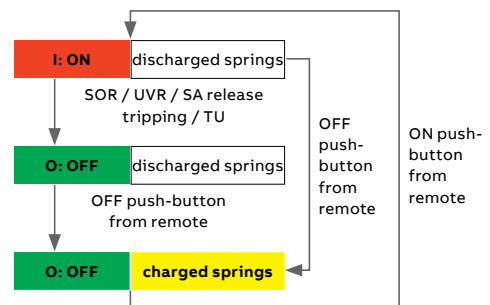

- a selector on the front of the MOE, is used for selecting the operating mode:
 - AUTO: when the selector is in this position, the push-buttons on the front of the motor are locked. Circuit-breaker closing is commanded remotely only by means of an electric impulse, whereas opening is allowed both remotely and from the front of the motor;
 - MANUAL: the circuit-breaker can only be opened/closed from the front of the motor using the relative push-buttons;
 - LOCKED: when the selector is in this position, the circuit-breaker is in the open position. The padlock device can be withdrawn and the motor can be locked in the open position;
- operation of the motor operator via remote control is also guaranteed by permanent electrical opening/closing impulses. Once an opening command has been given, the next closing command (permanent) is taken over by the motor operator once the opening has been completed. In the same way, an opening command is taken over once the previous closing operation has been completed.

When the Ekip Com module is used, the MOE-E motor operator must be used instead of the MOE motor operator. The MOE-E allows the digital signals from the supervision and monitoring system to be used by means of the release and Ekip Com contacts and to be converted into power signals to command the motor operator. All the features described above for the MOE motor operator are available also on the MOE-E version.

Operating mode: Manual

Operating mode: Auto

Remote control

Stored energy motor operators - MOE and MOE-E XT5 and MOE XT6

Stored energy motor operator (MOE)

The MOE or MOE-E stored energy motor operator available for the XT5 and XT6 is supplied:

- with 3.28 ft long cables;
- with connectors for the fixed part and moving part of withdrawable devices. If the motor operator is used with fixed or plug-in circuit-breakers, the connector can be easily removed;
- with a flange, to use instead of the standard one supplied with the circuit-breaker;
- with a padlock device, only removable when the motor is in the open position. The padlock device accepts up to three 0.3in padlocks;
- with a lock for the AUTO-MANUAL selector;
- with auxiliary contacts that allow the motor control mode (manual or remote) signal to be routed outside;
- (on request) the motor operator can be equipped with a key lock (see the Chapter "Accessories" - section "Locks");
- (on request) the motor operator can be equipped with a key lock to safeguard against manual operation (MOL-M) (see the Chapter "Accessories" - section "Locks").

Operating principles:

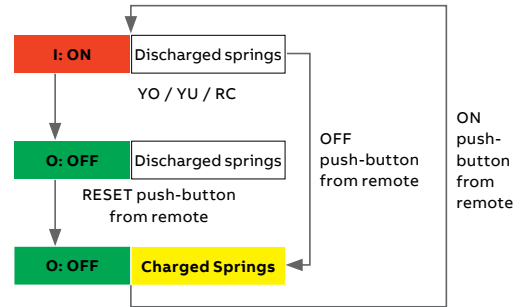

- a selector on the front of the MOE, is used to select the operating mode:
 - AUTO: when the selector is in this position, the push-buttons on the front of the motor are locked and covered by a sliding cover. It is possible to seal the sliding cover to avoid mode changing. Circuit-breaker closing is commanded remotely only by means of an electric impulse, whereas opening is allowed both remotely and from the front of the motor using a tool;
 - MANUAL: the circuit-breaker can only be opened/closed from the front of the motor using the relevant push-buttons. It is possible to seal the sliding cover to avoid mode changing;
 - LOCKED: the device can be used only if the motor is in the open position and the springs are charged. The padlock device can be withdrawn and the can be motor locked in the open position;
- operation of the motor operator via remote control is also guaranteed by permanent electrical opening/closing impulses. Once an opening command has been given, the next closing command (permanent) is taken over by the motor operator once the opening has been completed. In the same way, an opening command is taken over once the previous closing operation has been completed.

When the Ekip Com module is used, the MOE-E motor operator must be used instead of the MOE motor operator. The MOE-E allows digital signals from the supervision and monitoring system to be used by means of the release and Ekip Com contacts and to be converted into power signals to command the motor operator. All the features described above for the MOE motor operator are also available on the MOE-E version.

Operating mode: Manual

Operating mode: Auto

With the XT5 MOE and MOE-E and the XT6 MOE, it is possible to define some reset logic in order to charge the springs automatically once the circuit-breaker has tripped depending on the reset wiring diagram chosen. Three different options are available:

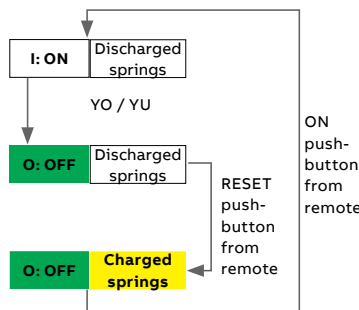

- Auto Reset: the circuit-breaker is automatically reset after a trip (not due to the trip unit) and the springs are charged;
- Remote Reset: it is possible to connect a push-button in order to charge the springs after a trip (not due to the trip unit);
- Manual Reset: charging springs must be done manually after a trip.

As explained in the motor circuit diagram, the auxiliary contact S51 must be properly connected to enable remote or automatic resetting. After a trip due to an overload or a short-circuit (trip unit), only a manual reset is permitted.

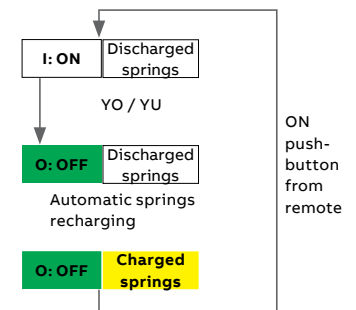

Manual Reset

Remote Reset

Auto Reset

Motor – M

Available on SACE Tmax XT7 M only, this motor automatically loads the closing springs of the circuit-breaker. The device automatically reloads the springs of the operating device when they are discharged and energized. In the event of a lack of power, the springs can be manually charged by using a dedicated lever on the operating device. The motor of the XT7 M can be equipped with an S33/M contact which signals the status of the springs that must be ordered separately.

Safety and protection

Terminal covers

Terminal covers

Terminal covers are applied to the circuit-breaker to prevent accidental contact with live parts, thus providing protection against direct contact. The terminal covers are pre-punched to facilitate the installation of busbars and/or cables, guaranteeing the correct insulation. The terminal covers are able to guarantee adequate circuit-breaker installation and correct insulation and are listed in the Chapter “Power Connection”.

There are different types of terminal covers:

- High terminal covers (HTC)
- Low terminal covers (LTC)
- Extended high terminal covers (HTC-ES), for front extended terminals
- High terminal covers with back shield (HTC_BS), with a back plate in order to guarantee insulation with the rear zone of the switchboard

The table below shows the terminal covers available for each frame:

	XT1		XT2		XT3		XT4		XT5		XT6		XT7/XT7 M	
	3p	4p	3p	4p	3p	4p	3p	4p	3p	4p	3p	4p	3p	4p
HTC - High terminal covers	■	■	■	■	■	■	■	■	■	■	■	■	■	■

HTC-ES_BS - Extended high terminal covers with back shield ⁽²⁾	-	-	-	-	-	-	-	-	■	■	■	■	■	■

(1) LTC height for XT5 is equal to 0.98 in; (2) Not compatible with XT5 Fixed Part

Phase separators

Phase separators

Phase separators increase the insulation characteristics between phases at the connection level. They are mounted from the front, even when the circuit-breaker has already been installed, by inserting them into the corresponding slots. The phase separators guarantee adequate circuit-breaker installation and correct insulation and are listed in the Chapter “Power connection”.

The following versions of phase separators are available:

- Low phase separators
- Medium phase separators
- High phase separators
- Rear phase separators for fixed part only

	XT1	XT2	XT3	XT4	XT5	XT6	XT7/XT7 M
Phase separator - low	[in] 0.98	0.98	0.98	0.98	0.98	-	-
Phase separator - medium	[in] 3.94	3.94	3.94	3.94	3.94	3.94	3.94
Phase separator - high	[in] 7.87	7.87	7.87	7.87	7.87	7.87	7.87
Rear phase separator for FP	[in] 3.54	3.54	3.54	3.54	3.54	-	-

Sealable screws for terminal covers

The lead sealing kit consists of screws which prevent the removal of the terminal covers, providing protection against direct contacts and tampering. The screws can be locked with wire and lead seals. Each sealing kit consists of two screws. The maximum number of sealable screws that can be used for each circuit-breaker is given in the table below.

Sealable screws

	[No.]	XT1		XT2		XT3		XT4		XT5		XT6	
		3p	4p	3p	4p	3p	4p	3p	4p	3p	4p	3p	4p
Max number sealable screws for each terminal cover		1	1	1	1	1	2	1	1	1	1	1	1

Safety and protection

Fixed padlock in open position

Fixed padlock in the open/closed position

Removable padlock in the open position - PLL

Key lock

Padlock in the open position - PLC

Keylock - KLC

Lock to prevent door opening - DLC

Padlocks and key locks

Padlocks or key locks prevent the circuit-breaker from being closed and/or opened. They can be fitted:

- directly on the front of the circuit-breaker;
- on the rotary handle operating mechanism;
- on the front for lever operating mechanism;
- on the motor;
- to the fixed part of withdrawable version, to prevent a moving part from being inserted;
- on the front of the thermal-magnetic trip unit, to prevent the adjuster of the thermal part from being tampered with;
- on the shutters of the fixed part.

In the closed position, the locks do not prevent the mechanism from tripping due to the trip unit or a service release.

Padlocks and keylock for circuit-breaker

Type of lock	Circuit-breaker	Optional/standard supply	Position of circuit-breaker lock	Type of lock	Removability of key	
PLL Fixed padlock device	XT1...XT4	Optional	OPEN/CLOSE	Padlocks max 3 padlocks Ø 0.275 in stem (not supplied)	-	
	XT1...XT4	Optional	OPEN	Padlocks max 3 padlocks Ø 0.275 in stem (not supplied)	-	
	XT5, XT6	Optional	OPEN/CLOSE	Padlocks max 3 padlocks Ø 0.315 in stem (not supplied)	-	
	XT5, XT6	Optional	OPEN	Padlocks max 3 padlocks Ø 0.315 in stem (not supplied)	-	
	XT7 ⁽¹⁾	Optional	OPEN	Padlocks max 3 padlocks Ø 0.315 in stem (not supplied)	-	
Circuit-breaker	PLC Fixed padlock device	XT7 M	Optional	OPEN	Padlocks max 3 padlocks Ø 0.157 in stem (not supplied) Padlocks max 2 padlocks Ø 0.315 in stem (not supplied) Padlocks max 1 padlocks Ø 0.275 in stem (not supplied)	-
	PLL Removable padlock device	XT1, XT3	Optional	OPEN	Padlocks max 3 padlocks Ø 0.275 in stem (not supplied)	-

	XT1...XT7	Optional	OPEN	Ronis 1228 Same key (A, B, C, D type)	OPEN/CLOSE	
	XT7 M	Optional	OPEN	Giussani Same key (20005/6/7/8/9)	OPEN	
	XT7 M	Optional	OPEN	Giussani Different key	OPEN	
KLC Arrangement key lock	XT5...XT6	Optional	OPEN	Kirk, Ronis 1104 and STI key lock	OPEN	
	XT7	Optional	OPEN	Kirk, Ronis 1104, STI and Castell key lock	OPEN	
	XT7 M	Optional	OPEN	Kirk, Ronis 1104, STI and Castell ⁽³⁾ key lock	OPEN	
DLC - Lock to prevent door opening when the circuit-breaker is in the closed position	XT7, XT7 M	Optional	-	This prevents the compartment door from being opened when the circuit-breaker is in the closed position (and with the circuit-breaker racked-in in case of withdrawable circuit-breakers). It also blocks the circuit-breaker from closing when the compartment door is open.	-	

(1) For XT7, the PLL is directly integrated in the plastic cover of the circuit-breaker

(2) For the XT1, XT2, XT3 and XT4, the KLC is incompatible with the electrical accessories mounted on the third pole.

(3) Factory mounted only

Padlocks and keylocks for handles

RHD with key lock

RHE with key lock

Type of lock	Circuit-breaker	Optional/standard supply	Position of circuit-breaker lock	Type of lock	Removability of key
Key lock ⁽¹⁾	XT1...XT7	Optional	OPEN	Ronis 1228 Same key (A, B, C, D type)	OPEN
	XT1...XT7	Optional	OPEN	Ronis 1228 Different key	OPEN
	XT1...XT7	Optional	OPEN	Ronis 1228 Same key (A, B, C, D type)	OPEN/CLOSE
Rotary handle (RHD/RHE/RHS)	Padlock device XT1...XT4	standard	OPEN	Padlocks max 3 padlocks Ø 0.236 in stem (not supplied)	-
	Padlock device XT5...XT7	standard	OPEN	Padlocks max 3 padlocks Ø 0.314 in stem (not supplied)	-
	Additional padlock device XT5...XT7	standard with dedicated RH code	OPEN	Padlocks max 3 padlocks Ø 0.314 in stem (not supplied)	-
Door lock ⁽²⁾	XT1...XT7	standard	Door locked when CB is closed	-	-

(1) On the transmitted rotary handle (RHE), the lock is mounted on the base. The key lock is not available on the lateral handle (RHS).

(2) When the handle is assembled, this function can be totally inhibited by the customer with a simple operation that can be reversed if needed. Moreover, if the door lock function is not disabled by the customer during the assembly phase, the door lock can be temporarily excluded with a tool in exceptional cases, so that the door can be opened without opening the circuit-breaker.

Padlocks and keylocks for front for the lever operating mechanism

FLD with key lock

(1) For the XT5 and XT6 this lock/padlock cannot be used with rear mechanical interlock

MOD with key lock

MOE with key lock

Key lock/padlock for withdrawable fixed part

Withdrawable fixed part with key lock/padlock

Padlock in racked-in/ test/racked-out position - PLP

Lock for thermal regulation

Type of lock	Circuit-breaker	Optional/standard supply	Position of circuit-breaker lock	Type of lock	Removability of key
Trip Unit	Lock for thermal regulation ⁽¹⁾	XT1, XT3	Optional	-	-
		XT2, XT4, XT5, XT6	standard	-	-

(1) This is applied to the cover of the circuit-breakers on level with the regulator of the thermal element of the thermal-magnetic release TMD and prevents it from being tampered with.

Lock for shutters of fixed parts

Type of lock	Circuit-breaker	Optional/standard supply	Position of circuit-breaker lock	Type of lock	Removability of key
Fixed Part	Shutter lock - SL	XT7, XT7 M	Optional	-	Padlocks max 3 padlocks Ø 8mm stem (not supplied)

IP Protection Kit

In order to improve the IP protection degree, some additional kits can be used.

IP54 Protection flange for direct rotary handle (RHD)

This flange can be mounted with the direct rotary handle of the XT5, XT6 and XT7 to guarantee an IP54 degree of protection.

With this flange is not possible to open the panel door when the circuit-breaker is in the closed position.

IP54 Protection for transmitted rotary handle (RHE)

This device can be fixed onto the transmitted rotary and lateral handle of the XT1, XT2, XT3 and XT4 allowing an IP54 degree of protection to be achieved. The IP degree of the transmitted rotary handle for the XT5, XT6 and XT7 is IP65 as standard without an additional accessory.

IP54 protection

IP54 protection for XT7 M

IP54 Protection flange for the MOE and XT7 M

This transparent cover completely protects the front of the circuit-breaker, guaranteeing an IP54 degree of protection. This accessory is provided with a double key lock (same or different keys).

This cover is available for the XT5 MOE/MOE-E, XT6 MOE and for the XT7 M circuit-breaker.

Safety and protection

Protection device for opening and closing pushbuttons - PBC

Protection device for opening and closing pushbuttons - PBC

This accessory is applied to the safety cover of the XT7 M and is available in two versions.

The push-button protection device blocks the operations on both the opening and closing push-buttons unless a special key is used.

The padlockable push-button protection device makes it possible to block either or both push-buttons and to lock the covers in place. It does not trip the breaker as a standard "Padlock device" would. The protection device for opening and closing push-buttons is an alternative to PLC padlocks.

Mechanical operation counter - MOC

Mechanical operation counter - MOC

The mechanical operation counter is available on the Tmax XT7 M only. This mechanical operation counter is visible on the front of the circuit-breaker and allows the user to see how many mechanical operations the device has performed.

Circuit-breaker with optional flange

Flange

This is a plastic plate that acts as an interface between the circuit-breaker and the hole in the panel door. All the Tmax XT flanges are newly designed and do not require screws for installation. The flanges can be applied:

- around the front part of the fixed/plug-in circuit-breaker;
- around the operating lever for all fixed/plug-in/withdrawable version circuit-breakers;
- around the MOD or MOE motor operator;
- around the front of FLD locks;
- around the direct rotary handle operating mechanism;
- around the RC Inst, RC Sel for the XT1 and XT3, and around the RC Sel for the XT2, XT4 and XT5.

Rotary handle with flange

MOE with flange

XT1-XT3 circuit-breaker with standard flange

	MIR Vertical	■	■	■	■	■	■	-	-
Cable interlocks	Type A (2 CBs)	-	-	-	-	-	-	■	■
	Type B, C and D (3 CBs)	-	-	-	-	-	-	■	■
Automatic transfer switch	ATS021	■	■	■	■	■	■	■	■
	ATS022	■	■	■	■	■	■	■	■

Interlock

Rear mechanical interlock

This is a support designed for installation on the rear of two circuit-breakers to be interlocked. It prevents the two circuit-breakers on which it is installed from closing simultaneously by linking components. Tmax XT circuit-breakers can be interlocked two-by-two (IO-OI-OO) by means of a chassis and special plates. Interlocked circuit-breakers can be in fixed, plug-in or withdrawable versions. Both circuit-breakers and switch-disconnectors in the 3 and 4 pole versions can be interlocked.

The allowed combinations are:

	XT1	XT2	XT3	XT4	XT5	XT6
XT1	■	■	■	■		
XT2	■	■	■	■		
XT3	■	■	■	■		
XT4	■	■	■	■	■	
XT5				■	■	■
XT6					■	■

The following equipment must be ordered to make a rear interlock:

- a vertical or horizontal chassis;
- a plate for each circuit-breaker to be interlocked.

For using an XT4 on an XT5 chassis and an XT5 on an XT6 chassis, dedicated plates are necessary.

Please note that remote closing commands sent to interlocked circuit-breakers in the open position must be prevented in order to ensure the correct functioning of the mechanical interlock. If this is not possible, key locks in the open position for the MOE are necessary.

With the XT5 and XT6 interlock chassis, for withdrawable version circuit-breakers, the use of the key-lock/ padlock for fixed parts (KLF) is not allowed.

Interlock - Chassis

Two plates

Interlock

Interlocks and switching devices

Cable interlocks

These interlock systems, for the Tmax XT7 and XT7 M, enable various opening and closing configurations to be obtained between two or three circuit-breakers. Four types of interlock configuration are available:

Type A

Excludes the possibility of having two circuit-breakers in the closed position at the same time.

The mechanical interlocks offer multiple solutions for installation that simplify their integration into the switchgear. The interlocks can be mounted:

- vertically VR
- horizontally HR

Maximum distance between two interlocked XT7 breakers is 2750mm in the horizontal configuration and 1000mm in the vertical one.

Mechanical interlocks are not compatible with AUX 15Q and the lock for preventing door opening when the circuit-breaker is in the closed position (DLC) and mounted on the right side.

—
ATS021—
ATS022

Automatic network-generator transfer unit ATS021-ATS022⁽¹⁾

The ATS (Automatic Transfer Switch) is a network-generator transfer unit used in installations where switching the main power line to an emergency line is required to ensure power supply to the loads in case of anomalies in the main line.

The unit is able to manage the entire transfer procedure automatically and prepares the commands for carrying out the procedure manually as well.

In the case of an anomaly in the main line voltage, in accordance with parameters set by the user, the opening of the circuit-breaker of the main line, the starting of the generator set (when provided) and the closing of the emergency line can be carried out. In the same way, when the line is supplied back, the procedure of reverse transfer is controlled automatically.

The new generation of the ATS (ATS021 and ATS022) offers the most advanced and complete solutions to guarantee service continuity. The ATS021 and ATS022 can be used with all the circuit-breakers as well as the molded case switches of the SACE Tmax XT family. The ATS021 and ATS022 devices have been designed to operate with a self-supply. The ATS022 unit also prepares the connection for the auxiliary power supply, which allows additional functions to be used.

The ATS021 and ATS022 devices carry out the control of both the power supply lines and analyze:

- phase unbalance;
- frequency unbalance;
- phase loss.

Apart from the standard control functions, the ATS022 enables the following operations:

- selection of the priority line;
- control of a third circuit-breaker;
- integration of the device in a supervision system with Modbus communication (an auxiliary power supply is needed);

Typical applications include: power supply to UPS (Uninterrupted Power Supply) units, operating theaters and primary hospital services, emergency power supplies for civil buildings, airports, hotels, data banks and telecommunication systems, and the power supply of industrial lines for continuous processes.

For the correct configuration, each circuit-breaker connected to the ATS021 or ATS022 must be fitted with the following accessories:

- a mechanical interlock;
- a motorized control for opening and closing;
- a key lock against manual operation for the motor operator;
- a signaling contact for the status (open/closed) and a signaling contact for tripping;
- a contact for the racked-in position (in the case of a withdrawable version circuit-breaker).

(1) Devices described in this section (ATS) are not UL listed.

Residual current protection according to IEC 60947-2 Annex B ⁽¹⁾

Residual current release

Both circuit-breakers and molded case switches are pre-engineered for assembly combined with residual current releases.

Residual current circuit-breakers derived from the circuit-breaker are known as “mixed”, meaning that, besides protection against the typical overloads and short-circuits, they also provide protection for people and against earth fault currents, thus protecting against direct, indirect contacts and risk of fire. Residual current circuit-breakers derived from molded case switches are “pure” residual current circuit-breakers, i.e. they only provide residual current protection and not the protection typical of circuit-breakers. “Pure” residual current circuit-breakers are only sensitive to earth fault currents and are generally used as main switches in small panels for distribution to end users.

Use of “pure” and “mixed” residual current circuit-breakers allows the insulation state of the installation to be continuously monitored. It ensures efficient protection against the risk of fire and explosions and also protects people against indirect and direct contacts, thereby integrating the compulsory measures established by the accident prevention Standards and Regulations.

The residual current releases comply with the following Standards:

- IEC 60947-2 Annex B;
- IEC 61000 for protection against unwanted tripping.

The table below gives all the residual current devices that can be used in combination with SACE Tmax XT family:

		XT1		XT2		XT3		XT4		XT5	
		3p	4p	3p	4p	3p	4p	3p	4p	3p	4p
Instantaneous residual current device	RC Inst	F	F			F	F				
Selective residual current device	RC Sel XT1-XT3	F	F			F	F				
	RC Sel 200		F								
	RC Sel XT2-XT4					F-P-W				F-P-W	
	RC Sel XT5										F-P-W
Type B residual current device	RC Type B XT3						F				

Tmax XT residual current devices:

- are designed for XT1, XT2, XT3 and XT4 microprocessor technology and act directly on the circuit-breaker by means of a dedicated opening solenoid (supplied with the residual current release and also available as a spare part) which must be housed in the relevant slot formed in the third pole on the left of the operating lever;
- are designed for XT5 feature microprocessor technology and act directly on the circuit-breaker by means of a dedicated mechanism integrated in the residual current itself;
- do not need an auxiliary supply as they are powered directly from the mains;
- can be supplied either from above or below;
- provide guaranteed functionality even with a single phase plus neutral or just two live phases and in the presence of pulsating unidirectional currents with direct components (minimum auxiliary voltage PHASE-NEUTRAL 85 Vrms);
- permit all possible connection combinations, as long as the neutral connection to the first pole on the left in the four-pole version is guaranteed.

(1) All the devices described in this section are not UL listed

Residual current protection

RC Sel residual current releases (type A) XT1

Thanks to its low height, the RC Sel 200 residual current release can be installed in 7.87in modules.

Moreover, its special shape reduces the overall size of the installation if two or more units are installed side by side.

RC Inst residual current releases for XT1 and XT3

RC Sel current releases (type A) for XT1 and XT3

With the RC Inst and RC Sel residual current releases for the XT1 - XT3 available in fixed versions only, it is possible to make rear terminal connections by ordering the RC Rear terminal 4p kits.

RC Sel residual current releases for XT2 and XT4

Residual current protection

The fixed version of the RC Sel residual current release can be easily converted:

- into a plug-in type of release:
 - by ordering the kit for converting the residual current release from the fixed to the plug-in version
- into a withdrawable type of release:
 - by ordering the kit for converting the residual current release from the plug-in to the withdrawable version. This kit contains the shunt opening release of the withdrawable residual current device to replace the shunt opening release supplied with the fixed version. The shunt opening release of the withdrawable residual current device contains both the connector for the moving part and the connector for the fixed part.

With the RC Sel residual current release for the XT2-XT4, it is possible to use the same terminals for the fixed circuit-breaker and for the fixed parts of the plug-in and withdrawable circuit-breakers.

With the withdrawable and plug-in versions, frame 160A with RC can be used up to a maximum current of 135A, whereas frame 250A can be used up to 210A.

RC Sel current releases (type A) for XT5

The fixed version of the RC Sel residual current release can easily be converted:

- into a plug-in type of release:
 - by ordering the kit for converting the residual current release from the fixed to the plug-in version into a withdrawable type of release:
- by ordering the kit for converting the residual current release from the plug-in to the withdrawable version.

With the RC Sel residual current release for the XT5, it is possible to use the same terminals for the fixed circuit-breaker and for the fixed parts of the plug-in and withdrawable circuit-breakers.

RC Sel for XT5 is always a four poles version that can be mounted also on a three-pole circuit breakers using the dedicated cover supplied in the RC kit.

RC B Type residual current releases (type B) for XT3

The RC residual current release type B, to be used in conjunction with the XT3 circuit-breaker, has the following features:

- it complies with type B operation, which guarantees sensitivity to residual fault currents with alternating, pulsating alternating and direct current components (in compliance with the Standards 60947-1, IEC 60947-2 Annex B, IEC/TR 60755);
- the maximum frequency band of the residual fault current detection can be selected (3 steps: 400 - 700 - 1000Hz). The residual current device can therefore be adapted to suit various industrial installation requirements according to the prospective fault frequencies generated on the load side of the release. Typical installations that may require different frequency thresholds from the standard ones (50 - 60Hz) include welding systems for the automobile industry (1000Hz), the textile industry (700Hz), airports and three-phase drives (400Hz).

Residual current protection

SACE RCQ020 panel type residual current release

SACE Tmax XT circuit-breakers can also be used in conjunction with RCQ020 panel type residual current releases with a separate toroid to be installed on the line conductors (“/A” indicates the necessity for an auxiliary power supply).

Thanks to its wide range of settings, the panel release is suitable for:

- applications where the installation conditions are particularly restrictive, such as for circuit-breakers that are already installed or where there is limited space in a compartment where the circuit-breaker is installed;
- creating a residual current protection system coordinated at various distribution levels, from the main switchboard to the end user;
- where residual current protection with low sensitivity is required, e.g. in partial (current) or total (time) selective chains;
- highly sensitive applications (physiological sensitivity) for protecting people against direct contacts.

Thanks to the 115-230...415V external auxiliary power supply, the RCQ020 panel type residual current device is able to detect current leakages from 30mA to 30A and to act with a trip time that can be adjusted from instantaneous to a delay of 5s. The opening mechanism is an indirect action type and acts on the circuit-breaker release mechanism by means of the shunt opening or an undervoltage release of the circuit-breaker itself.

The opening command to the circuit-breaker (trip delay) can be temporarily inhibited, and the circuit-breaker can be opened by remote control by means of the RCQ020 device.

The following equipment must be requested when ordering:

- the RCQ020 device itself;
- an opening coil (SOR) or an undervoltage release (UVR) of the circuit-breaker to be housed in the relative slot made in the left pole of the circuit-breaker itself;
- a closed toroid, which can be used for both cables and busbars, with a diameter from 60mm to 185mm.

Signals available:

- LED to indicate the status of the residual current device (supplied or not supplied). The RCQ020 is equipped with a positive safety function thanks to which the RCQ020 sends an automatic circuit-breaker opening command in the absence of auxiliary voltage;
- LED for fault signaling;
- LED for signaling tripping of the residual current device;
- electrical pre-alarm/alarm/trip signals.

✓ Compatible

(1) JW connector is needed to enable mounting of the YO/YU 3p version in the proper slot of the withdrawable shoulder
 The above table is made considering 24V + CAN connectors always present in the withdrawable fixed part shoulder

Position of the internal accessories for the Tmax XT1

Tmax XT1

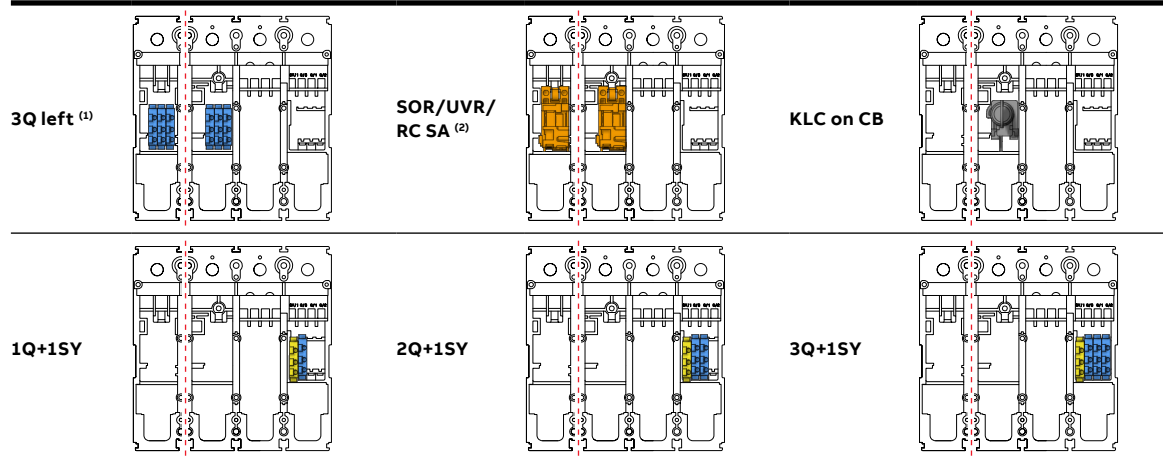

(1) For 4-pole version, 3Q left on the fourth pole only.

(2) RC SA on the third pole only.

Compatibility of accessories

Position of the internal accessories for the Tmax XT3

Tmax XT3

(1) For 4-pole version, 3Q left on the fourth pole only.
 (2) RC SA on the third pole only.

Position of the internal accessories for the Tmax XT2-XT4

Tmax XT2-XT4

(1) For 4-pole version, 3Q left on the fourth pole only.

(2) RC SA on the third pole only.

(3) Not available for the Ekip Touch and Hi-Touch trip units.

(4) Available only on Ekip LSI and Ekip LSIG.

(5) Available only on Ekip Touch/Hi-Touch trip units.

Compatibility of accessories

Position of the internal accessories for the Tmax XT5

Tmax XT5

With 4-pole circuit-breakers, it is not possible to add accessories to the fourth pole.

(1) YO or YU must be mounted on the third pole to make S52 signaling available.

(2) Ekip COM or stand-alone module, depending on the trip unit.

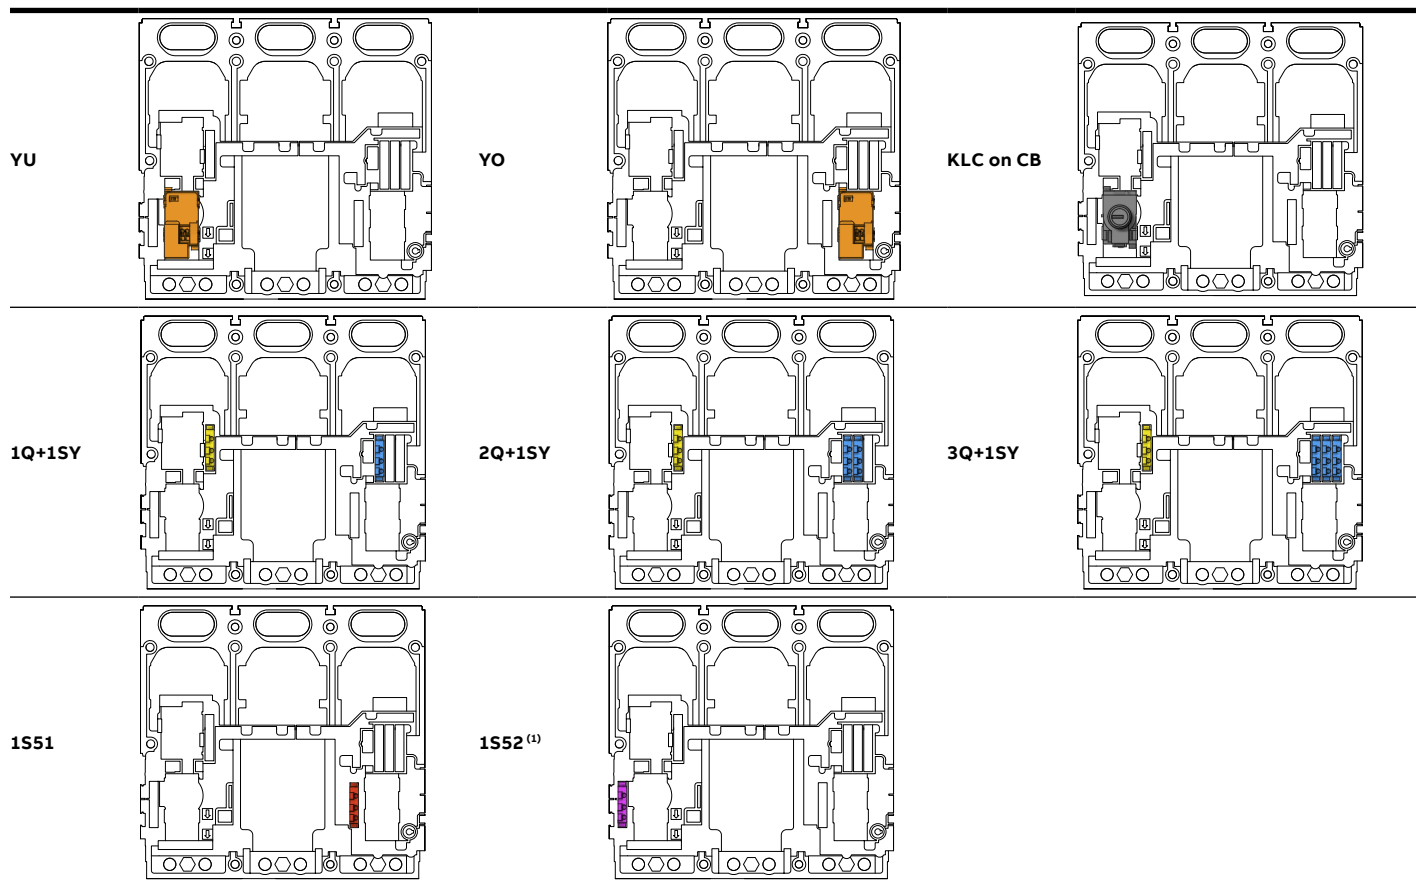

(3) Available for the Ekip Touch and Ekip Hi-Touch only.

(4) Available for the TM trip unit, Ekip Dip trip unit and molded case switches only.

Position of the internal accessories for the Tmax XT6

Tmax XT6

With 4-pole circuit-breakers, it is not possible to add accessories to the fourth pole.

(1) The YU must be mounted on the third pole to make S52 signaling available.

Compatibility of accessories

Position of the internal accessories for the Tmax XT7

Tmax XT7

All internal accessories for the XT7 can be mounted at the same time without any restriction concerning their compatibility. To guarantee proper operation of all accessories, please refer to the relevant tables (see previous pages).

Position of the internal accessories for the Tmax XT7 M

Tmax XT7 M

All internal accessories for the XT7 M can be mounted at the same time without any restriction concerning their compatibility. To guarantee proper operation of all accessories, please refer to the relevant tables (see previous pages).

Compatibility of accessories

Glossary

RHD	= Direct rotary handle	S51	= Contact signaling tripping due to trip unit
RHE	= Transmitted rotary handle	S52	= Contact signaling YO/YU tripping
RHS	= Lateral transmitted rotary handle	S33M/2	= Contact signaling loaded springs
CK RHE->RHS	= Conversion kit for converting an RHE into an RHS	AUE	= Early auxiliary contacts
FLD	= Front for lever operating mechanism	RTC	= Ready to close signaling contact
MOD	= Direct action motor operator	PBC	= Protection device for opening and closing pushbuttons
MOE/MOE-E	= Stored energy motor operator	MOC	= Mechanical operation counter
M	= Motor operator	NE	= Neutral external
PLL on CB	= Padlock device on circuit-breaker	AUX-MO	= Auxiliary contacts for stored energy motor operator
KLC on CB	= Keylock device on circuit-breaker	Micro I/O	= Module for Touch and Hi-Touch trip unit
RHL	= Keylock for rotary handle and front for lever operating mechanism	Ekip COM STA	= Communication module stand-alone
MOL on motor	= Keylock for motor operator	Ekip COM STA RTU	= Communication module stand-alone Modbus RTU
SOR	= Shunt opening release	Ekip COM STA TCP	= Communication module stand-alone Modbus TCP
UVR	= Undervoltage release	Ekip COM	= Communication module
YO	= Shunt opening release	Ekip COM act.	= Ekip COM actuator
YU	= Undervoltage release	Ekip 1K	= Ekip 1K signaling
YC	= Closing release	Ekip MM	= Ekip Maintenance Module
YR	= Remote resetting	Ekip COM LSI-LSIG	= Communication module for Ekip LSI and LSIG XT2-XT4
RC SA	= Coil for residual current device		
Q	= Contact signaling open/closed		
SY	= Contact signaling tripping

(1) Not compatible with mechanical locks on compartment doors or mechanical interlocks.

For XT7 M you need to order also one of the following items:

- Plate for fixed - floor mounted code 1SDA079783R1
- Plate for fixed - wall mounted code 1SDA079782R1
- Plate for withdrawable code 1SDA079784R1

For XT7 M withdrawable, the AUX 15Q works only in racked-in position.

2) Tripping signal is available only on YU/YO2 coils installed in the dedicated slot.

Test and configuration

Test and configuration

Size	Type	Code
XT2-XT4-XT5- XT6-XT7-XT7 M	Ekip TT - Trip test unit	1SDA066988R1
XT2-XT4-XT5- XT7-XT7 M	Ekip Programming	1SDA076154R1
XT2-XT4-XT5- XT6-XT7-XT7 M	Ekip T&P - Programming and test unit	1SDA066989R1

Current sensor

Current sensor for neutral conductor outside the circuit-breaker

Size	Type	Code
XT2	CT External neutral 10A Ekip Dip	1SDA067211R1
XT2	CT External neutral 25A Ekip Dip	1SDA067212R1
XT2	CT External neutral 60A Ekip Dip	1SDA081983R1
XT2	CT External neutral 100A Ekip Dip	1SDA069143R1
XT2	CT External neutral 125A Ekip Dip	1SDA081984R1
XT2	CS External neutral $I_n \leq 60A$ Ekip Touch with voltage	1SDA107406R1
XT2	CS External neutral $I_n \geq 100A$ Ekip Touch with voltage	1SDA107407R1
XT4	CT External neutral 40A Ekip Dip	1SDA066975R1
XT4	CT External neutral 60A Ekip Dip	1SDA081985R1
XT4	CT External neutral 100A Ekip Dip	1SDA066977R1
XT4	CT External neutral 150A Ekip Dip	1SDA081986R1
XT4	CT External neutral 225A Ekip Dip	1SDA081987R1
XT4	CT External neutral 250A Ekip Dip	1SDA066979R1
XT4	CS External neutral Ekip Touch with voltage	1SDA107408R1
XT5	CT External neutral 250A Ekip Dip	1SDA101966R1
XT5	CT External neutral 300A Ekip Dip	1SDA105152R1
XT5	CT External neutral 400A Ekip Dip	1SDA105154R1
XT5	CT External neutral 600A Ekip Dip	1SDA105155R1
XT5	CS External neutral voltage Ekip Touch	1SDA107409R1
XT6	CT External neutral 600A Ekip Dip	1SDA107671R1
XT6	CT External neutral 800A Ekip Dip	1SDA105158R1
XT6	CT External neutral 1000A Ekip Dip	1SDA105159R1
XT7-XT7M	CS External neutral up to 1200A	1SDA082134R1

Current sensor

Homopolar sensor

Toroid RC

Homopolar toroid for the earthing conductor of the main power supply

Size	Type	Code
XT7-XT7 M	Homopolar toroid 100A	1SDA073743R1
XT7-XT7 M	Homopolar toroid 250A	1SDA076248R1
XT7-XT7 M	Homopolar toroid 400A	1SDA076249R1
XT7-XT7 M	Homopolar toroid 800A	1SDA076250R1
XT7-XT7 M	Toroid RC 3p	1SDA073741R1

Modified differential ground fault terminals

Size	Type	Code
XT7-XT7 M	MFGF Terminal for fixed circuit breaker*	1SDA073743R1
XT7-XT7 M	MFGF Terminal for withdrawable circuit breaker*	1SDA073741R1

* External phase current sensor and external summing current transformer must be order separately

Rating plug for Ekip trip units

Rating plug

Rating plug

Size	Type	Loose supply	Installed
XT5	Rating Plug In=250A	1SDA101992R1
